Executive Summary

This report summarizes groundwater monitoring and corrective action activities completed between January 1 and December 31, 2025 at the former Coal Combustion Residuals (CCR) Bottom Ash Transfer (BAT) Impoundments at the Platte River Power Authority (Platte River) Rawhide Energy Station (Rawhide Station or Site), as required by 40 Code of Federal Regulations (CFR) Section 257.90(e) of the United States Environmental Protection Agency (USEPA) CCR Rule. The location of the CCR unit and program monitoring network for the CCR unit, including supporting monitoring wells, are illustrated on **Figure 1**.

At the start of the 2025 reporting period, Platte River was monitoring the former BAT Impoundments under the Assessment monitoring program outlined in 40 CFR Section 257.95. The Assessment monitoring program for the former BAT Impoundments was initiated on January 15, 2018 upon identification of Appendix III statistically significant increases (SSIs) over background (AECOM 2018). In the 2025 reporting period, monitoring data reported the detections of the following Appendix III constituents in downgradient monitoring wells at concentrations that represent SSIs over background:

- Calcium in monitoring wells BAT-04R and BAT-05
- Chloride in monitoring well BAT-01

Per CCR rule requirements, groundwater protection standards (GWPSs) were developed for each detected Appendix IV constituent and the data were tested for whether the concentrations represented statistically significant levels (SSLs) above their respective GWPSs. Downgradient wells with a constituent or constituents reported above GWPSs at an SSL are as follows:

- Cobalt in monitoring well BAT-05

Other salient points for the 2025 annual reporting period include:

- Semiannual Assessment-mode groundwater monitoring events were conducted in April/May and September/October. Monitoring involved sampling of background monitoring wells and downgradient monitoring wells.
- No program transitions (Detection to Assessment or vice versa) were triggered.
- Monitoring wells BAT-01 and BAT-05 were redeveloped on April 29, 2025, to improve groundwater yield and reduce high turbidity observed during the 2024 reporting period. Well development forms are included in **Appendix A**.
- Two characterization wells to further characterize groundwater conditions between the former BAT Impoundments and Hamilton Reservoir were completed in 2025. BAT-14 and BAT-15 were successfully installed and developed in June 2025. Groundwater was not observed while drilling the third intended characterization well, BAT-16, and the boring was abandoned. Boring logs for BAT-14, BAT-15, and BAT-16, and well installation records for BAT-14 and BAT-15 are provided in **Appendix B**.
- Based on available groundwater flow data, Hamilton Reservoir water elevation data, and the base elevations of the former BAT Impoundments, AECOM has concluded that the former BAT Impoundment area has become a groundwater evaporation basin and hydraulic sink for groundwater. This hydrogeologic setting supports that groundwater and therefore constituents of concern are contained at the former impoundments within this evaporation basin.

Planned activities for the next annual reporting period include:

- Completion of two semi-annual Assessment-mode groundwater monitoring events.
- Statistical evaluation of groundwater data for Appendix III and Appendix IV constituents.
- Abandonment of monitoring well BAT-13 due to insufficient presence of water.

- Update of the assessment of corrective measure (ACM) that was prepared in June 2019 and presented at a public meeting in November 2019 (AECOM 2019a). Additional monitoring is planned for 2026 to confirm the new groundwater conceptual model with the inward flow towards the former BAT impoundments and evaporation basin. The ACM will then be updated in 2026 to summarize corrective action to date (i.e. source material removal during BAT Impoundment decommissioning), demonstrate the new groundwater conceptual model within the evaporation basin, and evaluate whether additional remedial action is warranted for final remedy selection.

1.0 Introduction

This is the 2025 Annual Groundwater Monitoring and Corrective Action Report for the former Coal Combustion Residuals (CCR) Bottom Ash Transfer (BAT) Impoundments at the Platte River Power Authority (Platte River) Rawhide Energy Station (Rawhide Station or Site) in Larimer County, Colorado. This report was developed by AECOM Technical Services, Inc. (AECOM) at the request of Platte River. The purpose of this report is to provide a summary of the groundwater monitoring activities performed in 2025 at the decommissioned BAT Impoundments to comply with the requirements of Title 40 of the Code of Federal Regulations (CFR) Part 257 Subpart D, known as the CCR Rule, which became effective on October 19, 2015. The rule provides standards for the disposal of CCR in landfills and surface impoundments (CCR units) and establishes groundwater monitoring requirements in 40 CFR §§ 257.90 - 257.95. In accordance with 40 CFR § 257.90(e), an annual report must be prepared to document the status of the groundwater monitoring and correction action program (as applicable) for the CCR unit, summarize the key actions completed the previous year, describe any problems encountered, discuss actions taken to resolve the problems, and project key activities for the upcoming year. The annual report will be considered complete when it is placed in the facility operating record by January 31, 2026.

1.1 Report Organization

This report is divided into eight sections as outlined below and includes text, tables, figures, and appendices. The sections include:

- Section 1.0 includes an introduction and report organization;
- Section 2.0 provides a facility description that includes the facility location and operational history, a description of the CCR unit and a summary of the site hydrogeology;
- Section 3.0 summarizes the groundwater monitoring activities performed in 2025, and references appendices to this report that contain detailed documentation of those activities;
- Section 4.0 summarizes the groundwater sampling; groundwater flow characterization; sampling data analysis and results; and problems encountered, and actions taken during groundwater sampling;
- Section 5.0 provides the statistical analysis and results;
- Section 6.0 provides a projection of the key activities anticipated in 2026;
- Section 7.0 provides a summary and findings; and
- Section 8.0 provides a list of references cited in the report.

The report also includes five appendices that provide supporting documentation of the groundwater monitoring and related activities conducted in 2025 that include:

- Appendix A Groundwater Sampling Forms and Development Forms
- Appendix B Well Installation Records
- Appendix C Laboratory Analytical and Data Validation Reports
- Appendix D Groundwater Velocity Calculation Sheet
- Appendix E Statistical Analysis Results and Input/Output Files

2.0 Facility Description

2.1 Facility Location and Operational History

The Rawhide Station encompasses approximately 4,560 acres north of Wellington in Larimer County, Colorado. In addition to the plant buildings, the major feature of the facility is an approximately 500-acre dry-land constructed reservoir of reclaimed wastewater from the City of Fort Collins, also known as Hamilton Reservoir, which contains approximately 15,000 acre-feet of water and is used for cooling processes at the station. The power block area contains the boiler and turbine buildings, the air quality control equipment, and the administrative offices. A rail spur along the northern edge of the Site connects the Rawhide Facility with the mainline of the Burlington Northern Santa Fe Railway Company and is used to deliver coal and construction materials for plant operations. Six generating units are located at the Rawhide Station. Units A, B, C, D, and F are fueled by natural gas, and Unit 1 is fueled by coal mined from the Powder River Basin in Wyoming.

2.2 BAT Impoundments Description

The BAT Impoundments were located northwest of the main plant, south of the coal stockpile, and north of Hamilton Reservoir (**Figure 1**). Bottom ash produced during the coal combustion process was hydraulically sluiced from the Unit 1 boiler to one of the two BAT Impoundments. These impoundments also received resin filter backwash water from the demineralizer at the wastewater treatment plant. The impoundments were constructed in the early 1980s by excavating below grade into the underlying Pierre Shale and then lining the bottom with 18 inches of compacted clay. Each of the two impoundments measured approximately 725 feet by 225 feet at the surface (approximately 7.5 acres total) with a bottom elevation of 5,660 feet above mean sea level (amsl), a normal water elevation of 5,674 feet amsl, and a top of berm elevation of between 5,678 and 5,679 feet amsl.

In 2020, the BAT Impoundments were decommissioned per the requirements of 40 CFR §§ 257.101 and 257.102. The two impoundments were taken out of service following a transfer of operations to the Concrete Setting Tank which was constructed and tested in 2018 and 2019 and is located to the south and east of the former BAT Impoundments. During decommissioning of the BAT Impoundments, the CCR material was removed from the impoundments and hauled to the Ash Monofill located at the northwest corner of the site for disposal. Water present in the impoundments was transferred to the phosphorus removal system (PRS) ponds located east of the Ash Monofill. Following CCR material removal, the area was regraded and vegetated. Details of the BAT Impoundments decommissioning can be found in the Bottom Ash Transfer Impoundment Construction Completion Certification Report (AECOM 2021a). Groundwater in this area is currently being monitored to establish post-decommissioning groundwater conditions. Current data suggest that there is an inward flow of groundwater in the former BAT Impoundment area towards monitoring well BAT-05 as discussed in more detail in Section 4.0.

2.3 Rawhide Station Hydrogeology

The hydrogeology of the Rawhide Station is discussed in the Engineering Report and Operational Plan (EROP) for the Solid Waste Disposal Facility (Platte River 1980), and in the Final Report Investigation of the Groundwater Monitoring Program for the Bottom Ash Disposal Site conducted by Lidstone and Anderson (1989). According to the 1980 EROP, hydrogeology of the Rawhide Station was originally investigated by drilling and installing 23 piezometers in conjunction with the original geotechnical investigation of the Site prior to construction of the facility. Data from the piezometers indicated that a groundwater table exists within the weathered and fractured Pierre Shale bedrock beneath the Site, and in alluvial deposits along Coal Creek. The report indicated that the depth to groundwater varied across the Site from 11 to 67 feet below ground surface (bgs), with groundwater generally flowing to the south-southeast. The shallow water table, as explained in the 1980 EROP, was reported to be directly recharged by infiltration from precipitation and surface runoff.

Following construction and operation of the Rawhide Station, Lidstone and Anderson (1989) concluded that sufficient groundwater data were collected to determine that a mound had formed in the shallow, weathered, and fractured Pierre Shale in the vicinity of Hamilton Reservoir. After a review of available groundwater level information for Rawhide Station, AECOM concluded that the CCR units present at the Site are located hydraulically upgradient of any groundwater mound created by Hamilton Reservoir.

2.4 Former BAT Impoundments Hydrogeology

The uppermost water-bearing stratum around the former BAT Impoundments is identified as the weathered and fractured Pierre Shale, which lies approximately 3 to 17 feet bgs. However, some locations screened within the Pierre Shale between the former BAT Impoundments and Hamilton Reservoir are dry (BAT-16) or are not hydraulically connected to the surrounding wells as is the case of BAT-13, which has a groundwater elevation approximately 20 to 25 feet lower than surrounding wells, with minimal recharge observed. As noted above, the impoundments were constructed by excavating into the Pierre Shale, which created an environment in which groundwater appears to have been largely recharged by leakage from the former impoundments. Groundwater beneath the former BAT Impoundments is present under water table conditions, where the depth to groundwater ranged from 10.42 feet bgs in BAT-15 in September 2025 to 35.73 feet bgs in BAT-13 in April 2025.

Prior to BAT closure, groundwater flow was generally from north to south across the unit towards Hamilton Reservoir, generally following the topographic slope. However, a groundwater depression developed within the BAT Impoundments as the impoundments were drained of water and decommissioned between July and October 2020. This depression was evidenced by the lowest water levels occurring in BAT-02 and BAT-05. The water levels have recovered partially but still suggest inward flow to the former impoundments. Following decommissioning activities for the BAT Impoundment closure, AECOM reviewed the available groundwater flow data and concluded that the former BAT Impoundment area has become an evaporation basin and hydraulic sink for groundwater. Groundwater flows to the excavated area from all directions slowly enough that it is lost to evaporation and the former BAT Impoundments remain relatively dry at an elevation below that of Hamilton Reservoir as discussed further in Section 4.0 below. Under the current observed groundwater flow condition, the previously designated downgradient wells are retained for compliance evaluation purposes and analytical results are compared statistically to upgradient designated wells to identify differences even though the downgradient designated wells are not strictly downgradient of the unit due to the inward observed flow.

Previous reports indicate that little to no groundwater was present in geotechnical boreholes completed in the area of the BAT Impoundments at the time of their construction (Black & Veatch Consulting Engineers 1979). The BAT Impoundments were constructed on a local topographic high, suggesting that groundwater, if present, likely flowed away from the area of the impoundments prior to construction. The previously observed water table beneath the former BAT Impoundments, prior to impoundment decommissioning, appears to have been a perched saturated zone in the underlying weathered and fractured Pierre Shale. The drop and rebound of groundwater elevations in the monitored wells observed in 2020 through 2021, suggests that groundwater drained toward and into the BAT Impoundment excavations until the wells returned to equilibrium with natural static levels. Current groundwater flow conditions (2025) are discussed in Section 4.0 below.

3.0 Groundwater Monitoring Activities

This section summarizes groundwater monitoring activities conducted during 2025 to comply with the CCR Rule. Activities included:

- Measuring groundwater levels at each monitoring well prior to purging for sampling to provide potentiometric data.
- Conducting semiannual Assessment-mode groundwater monitoring events in April/May and September/October. Monitoring involved sampling of background monitoring wells and downgradient monitoring wells for analysis of Appendix III and Appendix IV constituents to identify potential releases from the former BAT Impoundments and to collect supplemental data to update the background statistics as needed.
- Statistical analysis of the 2025 Appendix III and Appendix IV monitoring data to determine if there were any statistically significant increases (SSIs) over background and whether any of the SSIs were above groundwater protection standards (GWPS) at a statistically significant level (SSL).
- Installation of new characterization wells to further delineate groundwater flow conditions between the former BAT impoundments and Hamilton Reservoir in June 2025. Two of the planned characterization wells, BAT-14 and BAT-15, were successfully installed. A third well, BAT-16, was drilled but not installed due to the absence of groundwater at the boring location.
- Monitoring well redevelopment in April 2025 of BAT-01 and BAT-05 to reduce elevated turbidity levels in the wells.

Assessment-mode groundwater monitoring and statistical analysis was completed in accordance with the CCR BAT Impoundments Groundwater Detection Monitoring Plan (AECOM 2017).

3.1 Water Level Measurements

During each monitoring event, groundwater levels in BAT Impoundment monitoring network wells and characterization wells were measured using an electronic water level meter. **Table 1** presents monitoring well survey locations, and well construction details including surveyed top of casing elevation results. Groundwater level measurements were recorded to the nearest hundredth (0.01) of a foot. The water level meter cable and sensor were decontaminated at the start of field activities and after use at each well to limit the potential for cross-contamination between wells. Water level measurements were recorded on groundwater sampling forms, provided in **Appendix A**, and are tabulated in **Table 2** for the groundwater sampling events in April/May and September/October 2025.

3.2 Groundwater Sample Collection

Appendix III and Appendix IV Assessment monitoring groundwater samples were collected from BAT Impoundment monitoring wells BAT-01, BAT-02, BAT-03, BAT-04R, BAT-05, BAT-06, BAT-09, BAT-10, BAT-11, and BAT-12 from May 6 to May 14, 2025, and October 2 to October 7, 2025. BAT-13, BAT-14, and BAT-15 were considered characterization wells to help determine groundwater flow in the area of the former BAT Impoundments so groundwater samples were not collected during the 2025 monitoring year.

Groundwater samples were collected in accordance with the CCR BAT Impoundments Groundwater Detection Monitoring Plan (AECOM 2017). Each well was initially purged using a submersible bladder pump and dedicated polyethylene bonded tubing. Disposable bladder liners were replaced and the pump casing was decontaminated prior to purging and sampling each monitoring well to avoid cross-contamination between wells. The bladder pump and tubing were lowered into the well to a depth within the screen interval that was at least 1 to 2 feet off the bottom of the well to avoid disturbing accumulated

sediment in the lower part of the well screen. Monitoring wells were purged using low flow sampling techniques until field parameter measurements of pH, temperature, dissolved oxygen, oxidation reduction potential, turbidity, and conductivity stabilized within ± 10 percent and drawdown in the well was less than 0.33 feet for three consecutive readings. If wells did not stabilize within 45 to 60 minutes of purging, notes were made regarding stabilization of the well on field forms and samples were collected. Purge water volumes were also recorded on groundwater sampling forms (**Appendix A**).

After purging, the groundwater samples were collected directly into laboratory-supplied sample containers from the discharge tube of the bladder pump. Sample water was slowly pumped into each laboratory sample container until the containers were appropriately filled, taking care not to spill the laboratory preservative contained in sample bottles. The sample containers were then labeled and placed on ice in a sample cooler. At the conclusion of the field day, the samples were delivered by overnight carrier (FedEx) to Pace Analytical in Greensburg, Pennsylvania (radium samples only) and Lenexa, Kansas (May samples only) or Minneapolis, Minnesota (October samples only) for analysis.

3.3 Analytical Program

Groundwater samples collected from the former BAT Impoundment wells were analyzed using United States Environmental Protection Agency (USEPA) SW-846 methods for Appendix III and IV constituents. All analytical results are reported as totals. **Table 3** summarizes the 2025 groundwater analytical results for each sampling event. The laboratory analytical reports are provided in **Appendix C**. Analytical methods switched from 6020 to 6010 in 2024 as the laboratory had equipment interference affecting reporting limits for metals results for method 6020. As laboratories were switched from Pace Kansas to Pace Minneapolis in 2025 after the August 2025 monitoring event, laboratory interference issues with method 6020 were resolved and metals analysis returned to method 6020 for the October monitoring event.

Appendix III constituents include:

| Chemical Name | Analytical Method |
|---------------|--|
| Boron | 6010C ¹ / 6020B ² |
| Chloride | 9056A ¹ / 300.0 ² |
| Calcium | 6010C ¹ / 6020B ² |
| Fluoride | 9056A ¹ / 300.0 ² |
| pH | Field measurement |
| Sulfate | 9056A ¹ / 300.0 ² |
| TDS | TDS (American Public Health Association et al. [1998] standard method 2540C) |

TDS = total dissolved solids.

¹ = analytical method used during May event only

² = analytical method used during October event only

Appendix IV constituents include:

| Chemical Name | Analytical Method |
|------------------------------|---|
| Antimony | 6020B |
| Arsenic | 6010C ¹ / 6020B ² |
| Barium | 6010C ¹ / 6020B ² |
| Beryllium | 6010C ¹ / 6020B ² |
| Cadmium | 6010C ¹ / 6020B ² |
| Chromium | 6010C ¹ / 6020B ² |
| Cobalt | 6010C ¹ / 6020B ² |
| Fluoride | 9056A ¹ / 300.0 ² |
| Lead | 6010C ¹ / 6020B ² |
| Lithium | 6010C ¹ / 6020B ² |
| Mercury | 7470A |
| Molybdenum | 6010C ¹ / 6020B ² |
| Selenium | 6010C ¹ / 6020B ² |
| Thallium | 6020B |
| Radium 226 and 228, combined | total radium calculation |

¹ = analytical method used during May event only

² = analytical method used during October event only

Total radium calculation is based on radium-226 (Method 903.1) and radium-228 (Method 904.0) results.

3.4 Quality Control/Quality Assurance

Quality assurance and quality control samples collected during sampling activities included one field duplicate for each round of assessment monitoring, one equipment rinse blank, and one matrix spike/matrix spike duplicate sample. The field duplicate samples were collected by alternating filling sample bottles between the primary and duplicate sample. The equipment rinse blank samples were collected after decontaminating the bladder pump casing or fluid level meter using techniques outlined in the Sampling and Analysis Plan.

3.5 Data Validation

The laboratory data were validated by AECOM chemists using USEPA guidance. Data validation reports are provided in **Appendix C**.

3.6 Well Redevelopment and Installation

Monitoring wells BAT-01 and BAT-05 were redeveloped on April 29, 2025, in attempts to reduce sample turbidity in the wells as turbidity measurements in previous years showed increasing trends. Wells were surged and purged using a submersible pump. Each well was purged dry a minimum of two times before redevelopment was considered complete. While purging BAT-01, the submersible pump became stuck at the bottom of the well and separated from its connective wiring. The pump could not be recovered; however, the water column in the well was sufficient to collect a full sample during the September/October 2025 monitoring event. Well development forms are provided in **Appendix A**.

New characterization wells BAT-14 and BAT-15 and soil boring BAT-16 were installed between June 4 and June 9, 2025, between the former BAT Impoundments and Hamilton Reservoir to better characterize groundwater conditions between the two areas. The boring logs and installation details are provided in **Appendix B**. Wells were surged and purged using a bailer or submersible pump. Each well

was either purged dry during the process or had up to 10 well volumes of water removed before redevelopment was considered complete. Well development forms for BAT-14 and BAT-15 are provided in **Appendix A**. No indication of groundwater was observed during the drilling of BAT-16 and therefore, a monitoring well was not installed at this location. The boring was plugged with hydrated bentonite and abandoned.

4.0 Monitoring Results and Evaluation

This section discusses the characterization of groundwater flow between the former impoundments and Hamilton Reservoir, potentiometric surface elevations, groundwater flow rates, and groundwater analytical results for the former BAT Impoundments during 2025.

4.1 Groundwater Flow Characterization Between the Former BAT Impoundments and Hamilton Reservoir

As noted in Section 2.3, groundwater generally flows inward from all directions towards the former BAT Impoundments. Characterization wells BAT-14 and BAT-15 were newly installed to further characterize groundwater movement in the area between the former BAT Impoundments and Hamilton Reservoir. Fluid levels within BAT-14 and BAT-15 in September 2025 show groundwater levels higher than those in monitoring wells surrounding the perimeter of the former impoundments (i.e. BAT-02, BAT-03, BAT-05, and BAT-06). This data indicates that groundwater also flows towards the former BAT Impoundments from the direction of Hamilton Reservoir. Potentiometric surface maps depicting groundwater elevations in April 2025 and September 2025 are included as **Figure 2** and **Figure 3**, respectively.

Figure 4 presents hydrographs for the former BAT Impoundment well network. In general, the water levels in the BAT network wells have fluctuated over time. The fluctuations appear to be related to decreasing impoundment water levels during decommissioning as evidenced by decreasing water levels in several wells in September 2019 when dewatering operations of the former BAT Impoundments began. Groundwater elevations dropped significantly following the decommissioning and draining of the former BAT Impoundments between the July and October 2020 sampling events, as observed on the **Figure 4** hydrograph. Many of the BAT network compliance wells showed an increase in the second half of 2021 before beginning to display a pattern of seasonal fluctuations with a slight decreasing trend through the end of the 2025 reporting period (BAT-01, BAT-03, BAT-04R, and BAT-06). However, groundwater levels in BAT-02 and BAT-05 have remained at lower elevations post-decommissioning.

Cross-section A-A' further depicts groundwater data and geology across the former BAT Impoundments. **Figure 5a** shows the location of cross-section A-A' which is presented as **Figure 5b**. Cross-section A-A' includes geologic data from soil borings and monitoring wells, post-closure survey data of the former BAT Impoundments (AECOM 2021a), and groundwater elevation data from the surrounding monitoring wells. Groundwater in the area of the former BAT Impoundments is typically found in the weathered shale, although some locations between the former impoundments and Hamilton Reservoir are dry (BAT-16) or are not hydraulically connected to the surrounding wells as is the case of BAT-13, which has a groundwater elevation approximately 20 to 25 feet lower than surrounding wells, with minimal recharge observed. Groundwater levels in perimeter wells BAT-01, BAT-02, BAT-03, BAT-04R, BAT-05, and BAT-06 are higher than the base elevations of the former north and south impoundments which are 5662 feet amsl and 5660 feet amsl, respectively (AECOM 2021a). This elevation difference allows groundwater to flow inwards towards them and be exposed to the atmosphere. The atmospheric exposure and inward groundwater flow from all four directions effectively renders the former impoundments an evaporation basin and a hydraulic sink for groundwater.

4.1.1 Groundwater Potentiometric Surface

Groundwater elevations were used to prepare potentiometric surface maps for the April/May and September/October 2025 monitoring events (**Figure 2** and **Figure 3**). These maps indicate that groundwater in the uppermost aquifer beneath the former BAT Impoundments flows back into the impoundment area towards monitoring wells BAT-02 and BAT-05 at an average hydraulic gradient of 0.0153 foot per foot in 2025 between monitoring wells BAT-10 and BAT-05. Due to groundwater movement towards/into the former impoundment area and effectively being removed via evaporation associated with the arid climate of the Site, there is no traditional downgradient compliance point at

which groundwater can be monitored for release of contaminants. As an interim measure, all surrounding monitoring wells (BAT-01 through BAT-06) are treated as downgradient compliance wells. Groundwater elevations will continue to be monitored to see if flow patterns remain as observed generally flowing towards the BAT Impoundments area.

4.1.2 Groundwater Flow Rate

An average groundwater flow rate was calculated for the uppermost aquifer beneath the former BAT Impoundments using the average hydraulic gradient (0.0153 foot per foot) between monitoring wells BAT-10 and BAT-05 (furthest upgradient point to lowest downgradient point); the minimum (0.0002 foot per day [ft/day]) and maximum (0.33 ft/day), and geometric mean (0.029 ft/day) hydraulic conductivities determined from historic slug tests; and an assumed effective porosity of 15 percent for fractured Pierre Shale. The results indicate that groundwater in the uppermost aquifer beneath the former BAT Impoundments in 2025 flows at a rate ranging from approximately $2.039\text{E-}5$ to $3.364\text{E-}2$ ft/day and a geometric mean of $2.956\text{E-}3$ ft/day towards the depression seen in groundwater in monitoring wells BAT-02 and BAT-05. **Appendix D** presents the calculation sheet for the groundwater velocity in 2025. These groundwater flow rates are higher than those reported prior to the decommissioning of the BAT Impoundments, which ranged from a minimum of $6.67\text{E-}6$ ft/day between BAT-10 and BAT-12 in 2020 to a maximum of $1.279\text{E-}2$ ft/day between monitoring wells BAT-11 and BAT-05 in 2021 (AECOM 2018, 2019b, 2020, 2021b, and 2022). Groundwater conditions in 2022 showed that groundwater was flowing inwards towards BAT-05 (AECOM 2023), while post-decommissioning conditions were still in flux. Similar conditions were observed between 2023 and 2025 as water continued to show inward flow towards BAT-05 (AECOM 2024, 2025).

4.2 Groundwater Analytical Results

Groundwater samples were collected from network monitoring wells and analyzed for Appendix III and Appendix IV parameters during the April/May and September/October 2025 sampling events and analyzed as specified in Section 3.3. The laboratory analytical reports are provided in **Appendix C**. The laboratory results were reviewed for completeness against the project-required analytical methods and the chain-of-custody forms and were subsequently validated by AECOM. The data were found to be valid and useable with qualification as outlined in the data validation reports provided in **Appendix C**. However, upon further review, laboratory reporting limits for several constituents including those for arsenic, cadmium, chromium, cobalt, and lead were provided above upper prediction limits (UPLs) for both the September/October 2024 and April/May 2025 sampling events. The decision was made to switch laboratories from Pace Analytical in Lenexa, Kansas to Pace Analytical in Minneapolis, Minnesota after the April/May 2025 sampling event in an effort to achieve reporting limits consistent with project needs.

Table 3 summarizes the groundwater analytical results for the April/May and September/October 2025 sampling events. Monitoring wells BAT-01, BAT-02, BAT-03, BAT-04R, BAT-05, BAT-06, BAT-09, BAT-10, BAT-11, and BAT-12 were sampled in May and October to fulfill the semiannual Assessment monitoring requirement. Final field parameter measurements prior to sample collection are presented on **Table 3**. Field forms are presented in **Appendix A** and present all field parameter measurements collected during the well purging process.

4.3 Groundwater Monitoring System Evaluation

Monitoring wells comprising the former BAT Impoundments groundwater monitoring network in 2025 were inspected during each sampling round and were found to be in good condition and capable of supplying a representative sample. Turbidity field measurements improved from May 2025 to October 2025 in wells that were redeveloped, including BAT-01 and BAT-05. Despite improved turbidity in well BAT-05, turbidity levels in this well were still considered elevated (greater than 300 nephelometric turbidity units [NTU]) during the October monitoring event.

Analysis of the 2025 potentiometric surface maps constructed using the groundwater elevation measurements from the monitoring events confirm that monitoring wells BAT-09 and BAT-10 are located upgradient of the former BAT Impoundments and represent background groundwater quality. Monitoring well BAT-11 was determined to be up- and cross-gradient of the former BAT Impoundments but not representative of background groundwater quality.

As discussed above, monitoring wells BAT-01, BAT-02, BAT-03, BAT-04R, BAT-05, BAT-06, and BAT-12 do not appear to be hydraulically downgradient of the former BAT Impoundments as there is inward flow towards BAT-02 and BAT-05 but are designated as downgradient in the event that groundwater conditions return to an equilibrium that reflects groundwater flow that more closely approximates the local topography that grades toward Hamilton Reservoir and to the east.

4.4 Problems Encountered and Actions Taken

No new problems were encountered or actions taken during 2025 aside from the unrecoverable submersible pump in monitoring well BAT-01 and elevated laboratory reporting limits that persisted between the September/October 2024 and April/May 2025 sampling events. A summary of these occurrences and the mitigative actions taken in 2025 are as follows:

- Monitoring well, BAT-01, was redeveloped on April 29, 2025 in an attempt to reduce sample turbidity in the well. While purging BAT-01 with a submersible pump, the pump became stuck at the bottom of the well and separated from its connective wiring during a retrieval attempt. Though the pump could not be recovered, sufficient water column remains in the well for the collection of groundwater samples. Analytical data for BAT-01 will continue to be monitored closely and if constituent concentrations appear to deviate from historical trends, a replacement monitoring well may be installed to ensure data integrity.
- Based on further review of groundwater data, the laboratory reporting limits for several constituents including those for arsenic, cadmium, chromium, cobalt, and lead were provided above UPLs for both the September/October 2024 and April/May 2025 sampling events. In an effort to achieve lower reporting limits consistent with project needs, the decision was made to switch laboratories from Pace Analytical in Lenexa, Kansas to Pace Analytical in Minneapolis, Minnesota after the April/May 2025 sampling event. Laboratory reporting limits for the September/October 2025 sampling event were below UPLs and GWPSs and thus considered satisfactory for the assessment of SSIs. Reporting limits will continue to be evaluated for project suitability as laboratory data is received from future events.

5.0 Statistical Analysis Results

The Appendix III and Appendix IV groundwater quality data were evaluated using the certified statistical approach presented in the CCR BAT Impoundments Groundwater Detection Monitoring Plan (AECOM 2017). The Appendix III and IV groundwater quality data were evaluated using an interwell approach that statistically compared constituent concentrations at downgradient monitoring wells to those present at background monitoring wells. For the Platte River former BAT Impoundments, monitoring wells BAT-09 and BAT-10 are designated as background wells because they are located upgradient of the former impoundments, whereas monitoring wells BAT-01, BAT-02, BAT-03, BAT-4R, BAT-05, BAT-06, and BAT-12 are designated as compliance wells because they are located adjacent to the former waste boundary or previously downgradient of the former impoundments prior to decommissioning. BAT-11 was removed from the background data set after the 2023 annual report after further review of data but will continue to be sampled as a characterization well in case groundwater flow directions change in the future. BAT-13, BAT-14, and BAT-15 were considered groundwater flow characterization wells during the 2025 monitoring year and were not sampled for incorporation into the statistically evaluated monitoring well network. BAT-13, which was considered as a possible well replacement for BAT-05, has historically had insufficient water volume for sampling and is planned to be decommissioned in 2026.

The statistical analyses were performed in accordance with the USEPAs Final CCR Rule 40 CFR Parts 257.93(f), 257.93(g), and 257.93(h) and the Statistical Method Certification (AECOM 2017). Prediction limits (i.e., parametric or nonparametric) with retesting, were developed using ProUCL Version 5.1 for each constituent based on the frequency of non-detect values and whether the background data for that constituent exhibited a normal, lognormal, or nonparametric distribution. For the statistical analysis, non-detect values were represented as one-half the detection limit. No outliers were identified in the background data. Analytical data from background monitoring wells BAT-09 and BAT-10 collected between March 2016 and October 2024 were used to redevelop a UPL for the Appendix III and IV background data at 95 percent confidence. The background data set was updated to reflect observed changes in the upgradient/background chemical conditions and the removal of BAT-11 from the program.

Data from the downgradient monitoring wells for the reporting period were compared to the updated UPL to identify SSIs over background. The Appendix III and Appendix IV UPLs are provided in **Table 4** and **Table 5**, respectively. The ProUCL statistical analysis input files and output files are provided in **Appendix E**.

5.1 Appendix III SSI Determination

The Appendix III results were compared against their respective background UPLs (**Table 4**) to determine if they exhibited SSIs above background. The statistical analysis results indicate that the Appendix III constituents of calcium at monitoring wells BAT-04R and BAT-05, and chloride at BAT-01 have verified SSIs over background UPLs as shown below. Sulfate in BAT-03 also exceeded the UPL in October but has not been verified as an SSI by subsequent sampling events to date (**Table 3**). Boron, fluoride, pH, sulfate, and TDS did not have any verified Appendix III SSIs over background. Appendix III SSIs found during 2025 are generally consistent with those identified between 2020 and 2024. However, compared with the Appendix III SSIs found during 2024, calcium at BAT-03, chloride at BAT-02, and sulfate at BAT-03 are no longer verified SSIs in 2025 due to results below background UPLs for a minimum of two consecutive events. These results confirm that Assessment monitoring is required at the former BAT Impoundments. Specific events where exceedances were observed, and analytical concentrations of detections can be found on **Table 3**.

| Well | Boron | Calcium | Chloride | Fluoride | pH | Sulfate | TDS |
|---------|-------|---------|----------|----------|------|---------|------|
| BAT-01 | ---- | ---- | SSI | ---- | ---- | ---- | ---- |
| BAT-02 | ---- | ---- | ---- | ---- | ---- | ---- | ---- |
| BAT-03 | ---- | ---- | ---- | ---- | ---- | ---- | ---- |
| BAT-04R | ---- | SSI | ---- | ---- | ---- | ---- | ---- |
| BAT-05 | ---- | SSI | ---- | ---- | ---- | ---- | ---- |
| BAT-06 | ---- | ---- | ---- | ---- | ---- | ---- | ---- |
| BAT-12 | ---- | ---- | ---- | ---- | ---- | ---- | ---- |

Notes:

---- = concentration below UPL.

SSI = statistically significant increase (Indicating concentrations above the background UPL).

TDS = total dissolved solids.

5.2 Appendix IV SSI Determination

The Appendix IV Assessment monitoring results were compared against their respective background UPLs (**Table 5**) to determine if they exhibited SSIs above background. This comparison indicates that barium at BAT-03 and barium, chromium, cobalt, and lead at BAT-05 were identified as having an SSIs above background as shown below. Cobalt in BAT-03 also exceeded the UPL in October but has not been verified as SSIs by subsequent sampling events to date (**Table 3**). No other Appendix IV constituents were identified as SSIs during the 2025 reporting period. SSLs were calculated for select constituents as described in Section 5.4 below.

| Well | Sb | As | Ba | Be | Cd | Cr | Co | F | Pb | Li | Hg | Mo | Ra | Se | Th |
|---------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| BAT-01 | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- |
| BAT-02 | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- |
| BAT-03 | ---- | ---- | SSI | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- |
| BAT-04R | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- |
| BAT-05 | ---- | ---- | SSI | ---- | ---- | SSI | SSI | ---- | SSI | ---- | ---- | ---- | ---- | ---- | ---- |
| BAT-06 | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- |
| BAT-12 | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- |

Notes:

---- = concentration below UPL.

SSI = statistically significant increase (Indicating concentrations above the background UPL).

5.3 Establishment of Groundwater Protection Standards

GWPSs were selected for the former BAT Impoundments using the criteria specified in 40 CFR 257.95(h). The GWPSs listed on **Tables 3, 4, and 5** were selected from the USEPA drinking water maximum contaminant levels (MCLs), groundwater standards provided in 40 CFR 257.95(h)(2), or the background UPLs where they exceed either of the regulatory standards.

5.4 Appendix IV SSL Determination

Appendix IV constituent cobalt at BAT-05, which exhibited an SSI over background, was further evaluated to determine whether those concentrations represent an SSL relative to the GWPS established under the CCR Rule [40 CFR 257.95(d)(2)]. SSLs are identified by calculating the 95 percent lower confidence limit (95% LCL) at each well where the Assessment monitoring constituents exhibited a verified SSI over background and comparing the 95% LCL to the GWPS. A constituent is present at an SSL over the GWPS if the 95% LCL is greater than the GWPS. Cobalt at monitoring well BAT-05 was

the only Appendix IV constituent found to be present at an SSL above its GWPS because its 95% LCL (0.00637 milligrams per liter [mg/L]) was greater than the GWPS of 0.006 mg/L as shown below. Appendix IV constituents that exceed the GWPS at an SSL require an alternate source demonstration or corrective action. No other Appendix IV constituents exhibited an SSL above the GWPS.

Post-decommissioning of the BAT Impoundments in 2020, groundwater levels and cobalt concentrations have generally decreased at BAT-05. Though the decreasing trend in cobalt concentrations appears to have slowed since May 2022, groundwater elevations recorded at BAT-05 continue to lower at a relatively consistent rate. BAT-05 will continue to be monitored closely to see how cobalt attenuates as groundwater levels continue to drop. A trend plot correlating the decreases in cobalt and groundwater elevations at BAT-05 after closure of the BAT Impoundments is presented as **Figure 6**.

| Well | Sb | As | Ba | Be | Cd | Cr | Co | F | Pb | Li | Hg | Mo | Ra | Se | Th |
|---------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| BAT-01 | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- |
| BAT-02 | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- |
| BAT-03 | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- |
| BAT-04R | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- |
| BAT-05 | ---- | ---- | ---- | ---- | ---- | ---- | SSL | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- |
| BAT-06 | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- |
| BAT-12 | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- |

Notes:

---- = concentration below UPL.

SSL = statistically significant level (indicating 95% LCL exceeded GWPS).

| Well No. | Parameter with SSI over background | 95% LCL (mg/L) | GWPS (mg/L) |
|----------|------------------------------------|----------------|-------------|
| BAT-05 | Cobalt | 0.00637 | 0.006 |

Notes:

Red highlighted value exceeds GWPS.

95% LCL = 95 percent lower confidence limit.

GWPS = Groundwater Protection Standard.

mg/L = milligrams per liter.

SSI = statistically significant increase.

6.0 Projected Activities in 2026

The following activities are planned to be performed at the former BAT Impoundments in calendar year 2026:

- Platte River will continue groundwater monitoring on a semiannual basis for the Appendix III and IV constituents that were detected as specified in 40 CFR 257.95(d)(1) or 40 CFR 257.95(f). The full list of Appendix IV constituents also will be sampled annually.
- Monitoring wells will continue to be monitored for high turbidity conditions. Elevated turbidity wells (greater than 100 NTU or wells having problematic results) may be redeveloped as needed.
- Monitoring well BAT-13 was determined in 2024 as an unsuitable replacement for monitoring well BAT-05, due to consistent and anomalously low groundwater yield that inhibits the ability to collect a complete sample set using the same method (low flow bladder pump) as the rest of the monitoring network wells. Abandonment of BAT-13 is scheduled for the 2026 monitoring year.
- Complete additional monitoring to confirm the new groundwater conceptual site model.
- An assessment of corrective measure (ACM) was prepared in June 2019 to identify potential remedial alternatives for cobalt in groundwater at the former BAT Impoundments. The ACM included a range of cleanup options that included monitored natural attenuation, groundwater pump and treat, and a permeable reactive barrier (AECOM 2019a). The ACM options were presented at a public meeting in November 2019. The BAT Impoundments were subsequently decommissioned and CCR material was removed as a corrective action in 2020. In 2026, the ACM will be updated to summarize corrective action to date, demonstrate groundwater control via the evaporation basin present in this area, and evaluate whether additional remedial action is warranted. Remedy selection will be based on adequate monitoring data, the site hydrogeology, contaminant migration pathways and contaminant exposure pathways.

7.0 Summary and Findings

AECOM, on behalf of Platte River, completed the groundwater sampling and analysis of semi-annual Appendix III and Appendix IV Assessment monitoring at the former BAT Impoundments. Monitoring data and analytical results collected as part of the Assessment monitoring program were evaluated to determine the aquifer hydraulic conductivities at the new monitoring wells, potentiometric surface elevations, groundwater flow directions and rates, and whether any constituents are present at an SSI above background UPLs or exceeded GWPSs at an SSL.

In 2025, Appendix III constituents which were considered SSIs in October 2024 but are not considered SSIs in October 2025 include calcium and sulfate at BAT-03, and chloride at BAT-02. Appendix IV constituents which were not considered SSIs in October 2024 but are considered SSIs in October 2025 include barium at BAT-03, and barium, chromium, and lead at BAT-05. These Appendix IV SSIs have been noted as SSIs in years prior to 2024. Statistical analysis found that cobalt exceeded the GWPS at an SSL at BAT-05 in October 2025. Platte River will continue to obtain groundwater analytical data on a semi-annual basis.

Two characterization wells (BAT-14 and BAT-15) and one soil boring (BAT-16) were installed in June 2025 to better understand groundwater flow conditions between the former BAT Impoundments and Hamilton Reservoir. Based on the data from these locations, Site groundwater flow data, Hamilton Reservoir water elevation data, and the base elevations of the former BAT Impoundments, AECOM has concluded that groundwater is flowing towards the former impoundment area from all four directions. This hydrogeologic setting and the arid climate of the Site support that groundwater and therefore constituents of concern, are contained at the former impoundments which act as an evaporation basin.

An ACM was prepared in June 2019 to identify potential remedial alternatives for cobalt in groundwater at the BAT Impoundments. The ACM included a range of cleanup options that included monitored natural attenuation, groundwater pump and treat, and a permeable reactive barrier (AECOM 2019a). The ACM options were presented at a public meeting in November 2019. The BAT Impoundments were subsequently decommissioned in 2020. Additional monitoring is planned for 2026 to confirm the new groundwater conceptual model with the inward flow towards the former BAT impoundments and evaporation basin. The ACM will then be updated in 2026 to summarize corrective action to date (i.e. material removal during BAT Impoundment decommissioning), demonstrate the new groundwater conceptual model with the evaporation basin, and evaluate whether additional remedial action is warranted for final remedy selection.

Notes:

- C = Celsius
- µs/cm = microSiemens per centimeter
- mg/L = milligrams per liter
- mV = millivolts
- NTU = nephelometric turbidity units
- pCi/L = picoCuries per liter
- SU = standard units
- FD = field duplicate
- N = primary sample
- < = less than reporting limit
- = not analyzed
- * = value inaccurate
- J = estimated concentration (+ = biased high, - = biased low)
- U = not detected
- ORP = oxidation reduction potential
- ¹ = analytical method used during May event only
- ² = analytical method used during October event only
- Bold black value is detected result
- Bold red value exceeds groundwater protection standard (GWPS)
- SSI = statistically significant increase over background upper prediction limit (UPL)
- SSL = statistically significant level above the GWPS

The GWPS represents the maximum contaminant limits (MCLs) outlined by 40 CFR 257.95 (h), unless the background UPL exceeds the MCL, in which case the GWPS will be represented by the UPL. For GWPSs represented by the UPL, the MCL is presented next to it in parentheses.

Notes:

- C = Celsius
- µs/cm = microSiemens per centimeter
- mg/L = milligrams per liter
- mV = millivolts
- NTU = nephelometric turbidity units
- pCi/L = picoCuries per liter
- SU = standard units
- FD = field duplicate
- N = primary sample
- < = less than reporting limit
- = not analyzed
- * = value inaccurate
- J = estimated concentration (+ = biased high, - = biased low)
- U = not detected
- ORP = oxidation reduction potential
- ¹ = analytical method used during May event only
- ² = analytical method used during October event only
- Black value is detected result
- Red value exceeds groundwater protection standard (GWPS)
- SSI = statistically significant increase over background upper prediction limit (UPL)
- SSL = statistically significant level above the GWPS

The GWPS represents the maximum contaminant limits (MCLs) outlined by 40 CFR 257.95 (h), unless the background UPL exceeds the MCL, in which case the GWPS will be represented by the UPL. For GWPSs represented by the UPL, the MCL is presented next to it in parentheses.

Table 4
Former BAT Impoundments Appendix III Background Upper Prediction Limits
PRPA Former BAT Impoundments Annual Report for 2025
PRPA Rawhide Facility, Colorado

| Parameter (Units) | Number of Samples | Percent Non-detects | Normal or Lognormal Distribution? | Statistical Test | Background Upper Prediction Limit |
|-------------------------------|--------------------------|----------------------------|--|-------------------------|--|
| Boron (mg/L) | 38 | 0 | No/No | Nonparametric | 2.39 |
| Calcium (mg/L) | 38 | 0 | No/No | Nonparametric | 433 |
| Chloride (mg/L) | 38 | 0 | No/No | Nonparametric | 190 |
| Fluoride (mg/L) | 39 | 54 | No/Yes | Parametric | 0.93 |
| pH (standard units) | 34 | 0 | Yes/Yes | Parametric | 7.77 |
| Sulfate (mg/L) | 35 | 3 | No/No | Nonparametric | 2,972 |
| Total Dissolved Solids (mg/L) | 38 | 0 | Yes/Yes | Nonparametric | 4,482 |

Notes:

BAT = Bottom Ash Transfer

mg/L = milligrams per liter

Upper prediction limits calculated using data from September 2016 through October 2024

Table 5
Former BAT Impoundments Appendix IV Background Upper Prediction Limits
PRPA Former BAT Impoundments Annual Report for 2025
PRPA Rawhide Facility, Colorado

| Parameter (Units) | Number of Samples | Percent Non-detects | Normal or Lognormal Distribution? | Statistical Test | Background Upper Prediction Limit | GWPS |
|---------------------------------|-------------------|---------------------|-----------------------------------|------------------|-----------------------------------|-----------------|
| Antimony (mg/L) | 39 | 82 | Yes/No | Parametric | 0.001 | 0.006 |
| Arsenic (mg/L) | 39 | 67 | Yes/Yes | Parametric | 0.003 | 0.01 |
| Barium (mg/L) | 39 | 0 | Yes/Yes | Parametric | 0.038 | 2.0 |
| Beryllium (mg/L) | 39 | 100 | No/No | RDL | 0.0005 | 0.004 |
| Cadmium (mg/L) | 39 | 97 | No/No | RDL | 0.0005 | 0.005 |
| Chromium (mg/L) | 39 | 79 | Yes/Yes | Parametric | 0.002 | 0.1 |
| Cobalt (mg/L) | 39 | 64 | Yes/Yes | Parametric | 0.002 | 0.006 |
| Fluoride (mg/L) | 39 | 54 | No/Yes | Parametric | 0.93 | 4.0 |
| Lead (mg/L) | 39 | 92 | Yes/Yes | Parametric | 0.001 | 0.015 |
| Lithium (mg/L) | 39 | 0 | No/No | Nonparametric | 0.33 | 0.33 (0.04) |
| Mercury (mg/L) | 39 | 100 | No/No | RDL | 0.0002 | 0.002 |
| Molybdenum (mg/L) | 39 | 10 | Yes/Yes | Parametric | 0.032 | 0.1 |
| Selenium (mg/L) | 39 | 36 | Yes/No | Parametric | 0.188 | 0.188 (0.05) |
| Thallium (mg/L) | 39 | 100 | No/No | RDL | 0.001 | 0.002 |
| Radium-226+228 Combined (pCi/L) | 38 | 0 | No/No | Nonparametric | 2.83 | 5.0 |

Notes:

BAT = Bottom Ash Transfer

GWPS = Groundwater Protection Standard

RDL = background limit set at standard reporting detection limit

mg/L = milligrams per liter

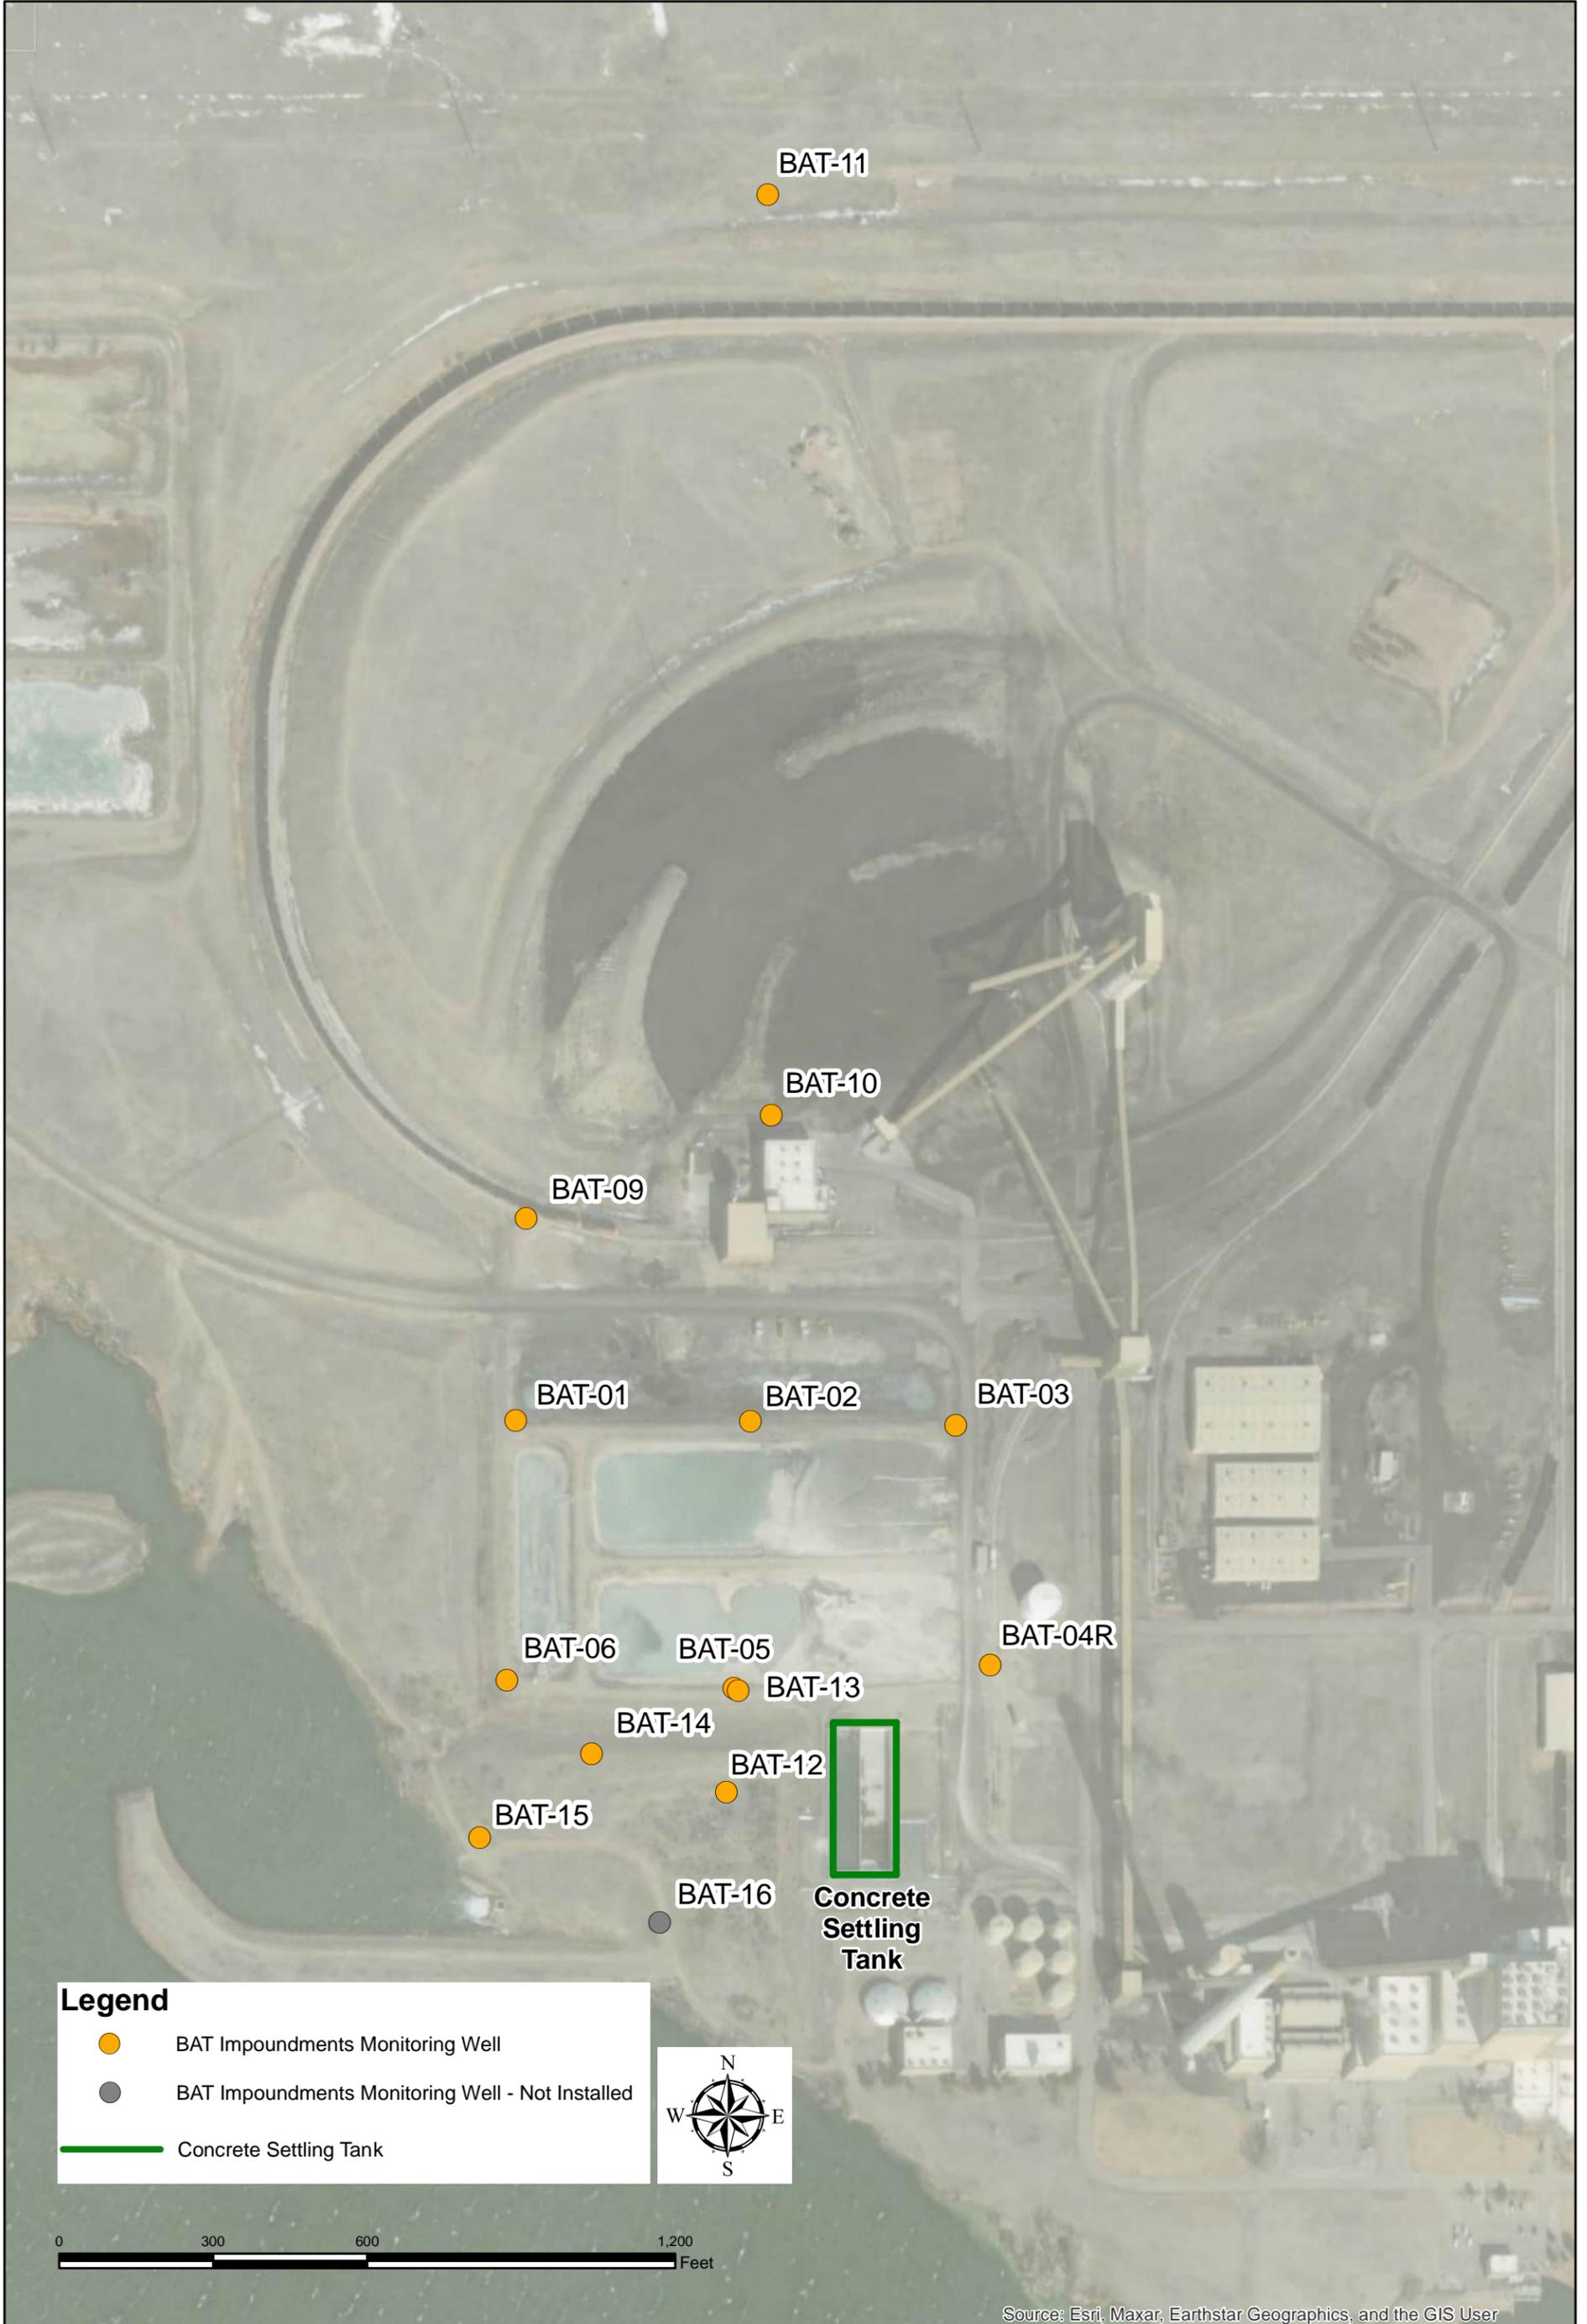

pCi/L = picoCuries per liter

Background Upper Prediction Limit calculated with data from September 2016 through October 2024

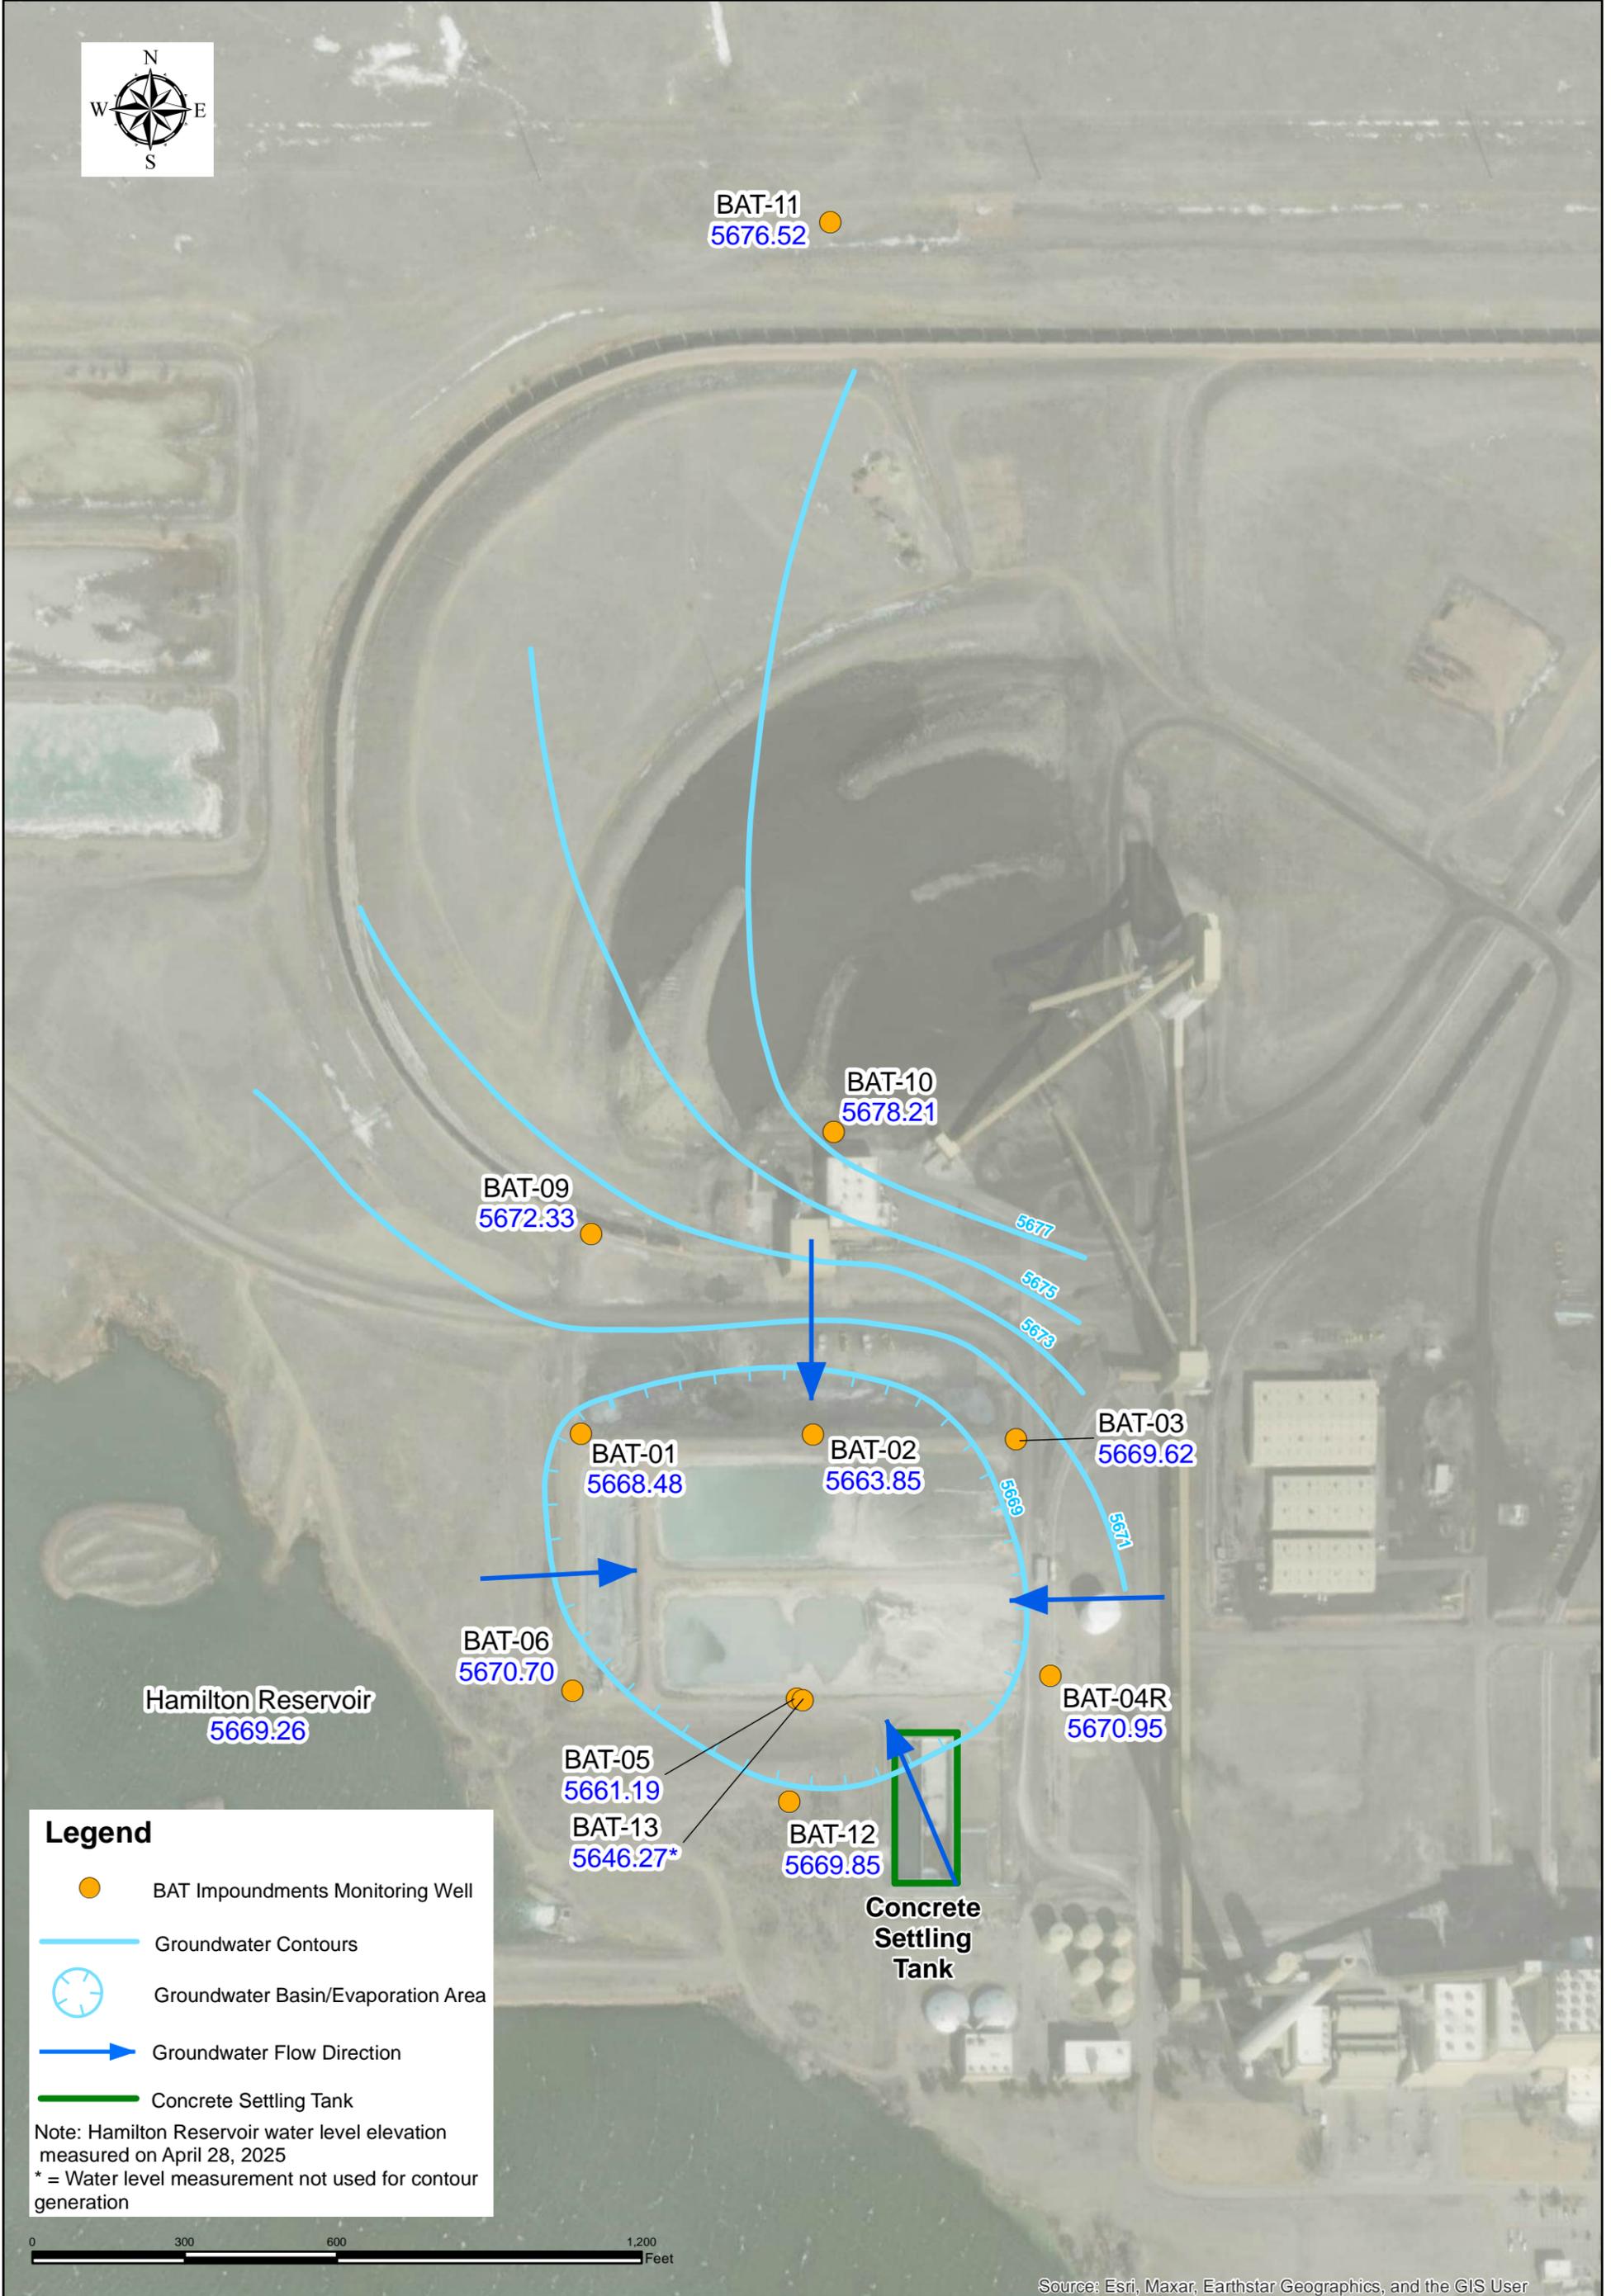

All of the beryllium, mercury, and thallium results in the background monitoring wells were reported as not detected and cadmium was only detected 3% of the time. For these constituents, the standard reporting detection limit was selected as the upper prediction limit (UPL) per the double quantification rule in the U.S. Environmental Protection Agency's Unified Statistical Guidance (2009).

The GWPS represents the maximum contaminant limits (MCLs) outlined by 40 CFR 257.95 (h), unless the background UPL exceeds the MCL, in which case the GWPS will be represented by the UPL. For GWPSs represented by the UPL, the MCL is presented below it in parentheses.

| 1322 | PURGED DRY | | | | | 20.8 |
| | | | | | | |
| | | | | | | |

COMMENTS: Agitated with pump. Purged dry 3 times, water did not clear. Submersible pump became suctioned/dug into sediment and became stuck. Tubing pulled out during removal, pump lost down well.

Final FL = 23.78 ft; Final TD = 28.56 ft

Laboratory Analytical and Data Validation Reports

April/May 2025

July 09, 2025

Vasanta Kalluri
AECOM
6200 South Quebec Street
Greenwood Village, CO 80111

RE: Project: 60754415 PRPA CCR
Pace Project No.: 60474660

Dear Vasanta Kalluri:

Enclosed are the analytical results for sample(s) received by the laboratory on May 07, 2025. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Greensburg

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Heather Wilson
heather.wilson@pacelabs.com

QUALIFIERS

Project: 60754415 PRPA CCR

Pace Project No.: 60474660

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Act - Activity

Unc - Uncertainty: SDWA = 1.96 sigma count uncertainty, all other matrices = Expanded Uncertainty (95% confidence interval).

Gamma Spec = Expanded Uncertainty (95.4% Confidence Interval)

(MDC) - Minimum Detectable Concentration

Trac - Tracer Recovery (%)

Carr - Carrier Recovery (%)

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

RE: Project: 60754415 PRPA CCR
Pace Project No.: 60474705

Dear Vasanta Kalluri:

Enclosed are the analytical results for sample(s) received by the laboratory on May 08, 2025. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Kansas City

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Heather Wilson

QUALIFIERS

Project: 60754415 PRPA CCR

Pace Project No.: 60474705

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

D3 Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.

E Analyte concentration exceeded the calibration range. The reported result is estimated.

M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

P6 Matrix spike recovery was outside laboratory control limits due to a parent sample concentration notably higher than the spike level.

R1 RPD value was outside control limits.

RE: Project: 60754415 PRPA CCR
Pace Project No.: 60474710

Dear Vasanta Kalluri:

Enclosed are the analytical results for sample(s) received by the laboratory on May 07, 2025. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Kansas City

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Heather Wilson

QUALIFIERS

Project: 60754415 PRPA CCR

Pace Project No.: 60474710

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

D3 Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.

E Analyte concentration exceeded the calibration range. The reported result is estimated.

M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

P6 Matrix spike recovery was outside laboratory control limits due to a parent sample concentration notably higher than the spike level.

R1 RPD value was outside control limits.

RE: Project: 60754415 PRPA CCR
Pace Project No.: 60474729

Dear Vasanta Kalluri:

Enclosed are the analytical results for sample(s) received by the laboratory on May 08, 2025. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Greensburg

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Heather Wilson

QUALIFIERS

Project: 60754415 PRPA CCR

Pace Project No.: 60474729

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Act - Activity

Unc - Uncertainty: SDWA = 1.96 sigma count uncertainty, all other matrices = Expanded Uncertainty (95% confidence interval).

Gamma Spec = Expanded Uncertainty (95.4% Confidence Interval)

(MDC) - Minimum Detectable Concentration

Trac - Tracer Recovery (%)

Carr - Carrier Recovery (%)

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

RE: Project: 60754415 PRPA CCR
Pace Project No.: 60474878

Dear Vasanta Kalluri:

Enclosed are the analytical results for sample(s) received by the laboratory on May 09, 2025. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Kansas City

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Heather Wilson

QUALIFIERS

Project: 60754415 PRPA CCR

Pace Project No.: 60474878

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

D3 Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.

E Analyte concentration exceeded the calibration range. The reported result is estimated.

M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

P6 Matrix spike recovery was outside laboratory control limits due to a parent sample concentration notably higher than the spike level.

R1 RPD value was outside control limits.

RE: Project: 60754415 PRPA CCR
Pace Project No.: 60474978

Dear Vasanta Kalluri:

Enclosed are the analytical results for sample(s) received by the laboratory on May 10, 2025. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Greensburg

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Heather Wilson

QUALIFIERS

Project: 60754415 PRPA CCR

Pace Project No.: 60474978

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Act - Activity

Unc - Uncertainty: SDWA = 1.96 sigma count uncertainty, all other matrices = Expanded Uncertainty (95% confidence interval).

Gamma Spec = Expanded Uncertainty (95.4% Confidence Interval)

(MDC) - Minimum Detectable Concentration

Trac - Tracer Recovery (%)

Carr - Carrier Recovery (%)

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

RE: Project: 60754415 PRPA CCR
Pace Project No.: 60475328

Dear Vasanta Kalluri:

Enclosed are the analytical results for sample(s) received by the laboratory on May 15, 2025. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Kansas City

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Heather Wilson

REPORT OF LABORATORY ANALYSIS

This report shall not be reproduced, except in full, without the written consent of Pace Analytical Services, LLC.

QUALIFIERS

Project: 60754415 PRPA CCR

Pace Project No.: 60475328

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

RE: Project: 60754415 PRPA CCR-Revised Report
Pace Project No.: 60475540

Dear Vasanta Kalluri:

Enclosed are the analytical results for sample(s) received by the laboratory on May 19, 2025. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Greensburg

Revised Report_rev.1 The Radium QC Appendix was added.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Heather Wilson

QUALIFIERS

Project: 60754415 PRPA CCR-Revised Report

Pace Project No.: 60475540

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Act - Activity

Unc - Uncertainty: SDWA = 1.96 sigma count uncertainty, all other matrices = Expanded Uncertainty (95% confidence interval).

Gamma Spec = Expanded Uncertainty (95.4% Confidence Interval)

(MDC) - Minimum Detectable Concentration

Trac - Tracer Recovery (%)

Carr - Carrier Recovery (%)

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

Data Validation Report

Project/Site: Platte River Power Authority/CCR BAT Wells
AECOM Chemist: Priya Nagwanshi
AECOM Secondary Reviewer: Jamie Herman

Event: 1SA Groundwater 2025
Date: 8/12 /2025
Date: 9/3/2025

Introduction:

This validation report documents the data review process through the checklists below. Further identification and explanation of any anomalies are provided following each section of the checklist, as needed.

The field sample and laboratory identification associations are summarized in Table 1.

Qualified data are summarized and presented in Table 2.

Laboratory and Sample Delivery Groups (SDGs):

Pace Analytical Services in Lenexa, Kansas – 60474705, 60474710, 60474878, 60475328,

Pace Analytical Services in Greensburg, Pennsylvania – 60474660, 60474729, 60474978, 60475540

Analytical Methods Validated:

Anions (chloride, sulfate, fluoride) by EPA Method 9056, total metals (select list) by EPA Methods 6010 and 6020, total mercury by EPA Method 7070A, total dissolved solids (TDS) by SM2540C, radium-226 by EPA Method 903.1, radium-228 by EPA method 904.0, and total radium (calculation).

Validation:

Stage 2A Validation

Validation Guidance Documents:

The data review was conducted in accordance with *National Functional Guidelines for Inorganic Superfund Methods Data Review* (EPA November 2020), and evaluation of laboratory criteria, as applicable.

Overall Assessment of Data:

As no data were missing or qualified as unusable during the validation process, the overall assessment of data was acceptable at 100%. Qualified data are summarized and presented in Table 2.

Date: 9/3/2025

1.0 Sample Documentation and Case Narrative

| Sample Documentation Criteria | Yes | No | NA |
|--|----------------|----|----|
| Were all samples documented correctly on the chain-of-custody (COC) and container labels? | X | | |
| Were sample analyses completed per the COC? | X | | |
| Were samples extracted and analyzed within the method required holding times? | X | | |
| Laboratory Case Narrative | Yes | No | NA |
| Were there additional narrative clarifications made by the laboratory, not addressed within this validation? | X ¹ | | |

1. **Data Package 60475540:** The laboratory revised and reissued the data package to include missing batch QC associated with Methods 903.1 and 904.0 for radiochemistry.

Data Validation Report

Event: 1SA Groundwater 2025
Date: 8/12 /2025
Date: 9/3/2025

2.0 Quality Control and Performance Checks

| Stage 2A Validation Criteria | | | |
|--|--------------------------------------|-----------|-----------|
| Method Blank Criteria | Yes | No | NA |
| Was a method blank analyzed for each batch, as applicable to the method? | X | | |
| Were method blank concentrations reported as not detected or less than the MDC? | X | | |
| Laboratory Control Sample Criteria | Yes | No | NA |
| Was an LCS reported with each preparation batch, as applicable to the method? | X | | |
| Were LCS/LCSD recoveries and/or RPDs within acceptance criteria? | X | | |
| Matrix Spike/Matrix Spike Duplicates Criteria | Yes | No | NA |
| Was an MS/MSD performed on a project specific sample? * | X | | |
| Parent Sample | Method | | |
| BAT-04R-CCR | 6010, 6020, 7470, 9056, 903.1, 904.0 | | |
| BAT-09-CCR | 6010 | | |
| BAT-01-CCR | 6010 | | |
| For concentrations <4x the spike concentration, were MS/MSD recoveries and RPDs within acceptance criteria? | X | | |
| Spike recovery limits and RPDs are not applicable when the parent sample concentration is $\geq 4x$ the spike added. The data is reported without qualification. | | | |
| Laboratory Duplicate Criteria – As applicable to the analytical method | Yes | No | NA |
| Was a laboratory duplicate performed on a project specific sample? | X | | |
| If both the parent sample and duplicate values were >5xRL, was laboratory duplicate RPD within laboratory acceptance criteria? | X | | |
| If either the parent sample or duplicate value was <5xRL, was the absolute difference within acceptance criteria of <2xRL for waters, and <3.5xRL for solids? | | | X |
| For radiological parameters, was the DER agreement between parent sample results and laboratory duplicate sample results ≤ 2 ? | X | | |
| Tracery/Carrier Recovery - Radiological | Yes | No | NA |
| The sample specific recoveries were within the laboratory limits (30-110%). | | | X |

Data Validation Report

Project/Site: Platte River Power Authority/CCR BAT Wells
AECOM Chemist: Priya Nagwanshi
AECOM Secondary Reviewer: Jamie Herman

Event: 1SA Groundwater 2025
Date: 8/12 /2025
Date: 9/3/2025

3.0 Field Quality Control Samples

| Field QC Blank Criteria | | Yes | No | NA |
|--|------------------------|-----|----------------|----|
| Was a trip blank shipped with, and analyzed with the samples? | | | | X |
| Were trip blank concentrations reported as non-detect for target analytes? | | | | X |
| Were field and/or equipment blanks collected and analyzed with the samples? | | X | | |
| Were field QC blank concentrations reported as non-detect or less than the MDC for radiological parameters, for the target analytes? | | X | | |
| Field Duplicate Criteria | | Yes | No | NA |
| Were field duplicate samples collected for this sampling event? | | X | | |
| Parent Sample | Field Duplicate Sample | | | |
| BAT-12-CCR | DUP-01-CCR | | | |
| If both the parent sample and/field duplicate sample results were >5xRL were the RPDs within the acceptance criteria of ≤30%? | | | X ¹ | |
| If either the parent sample or duplicate value was <5xRL, was the absolute difference within the acceptance criteria of <2xRL? | | X | | |
| For radiological parameters, was the DER agreement between parent sample results and field duplicate sample results ≤2? | | X | | |

1. The following field duplicate samples did not meet the QC acceptance criteria:

| Sample Identification | Method | Analyte | Parent Result | Field Duplicate Result | Unit | Criteria Not Met |
|---------------------------|--------|---------|---------------|------------------------|------|------------------|
| BAT-12-CCR/ DUP-01-CCR | 6010 | Barium | 38.7 | 61.1 | ug/L | RPD |

Both the parent and field duplicate sample results were qualified as estimated (J fd) to demonstrate the imprecision between the associated results. The qualified data are presented in Table 2.

Data Validation Report

Project/Site: Platte River Power Authority/CCR BAT Wells
AECOM Chemist: Priya Nagwanshi
AECOM Secondary Reviewer: Jamie Herman

Event: 1SA Groundwater 2025
Date: 8/12 /2025
Date: 9/3/2025

4.0 Sensitivity, Additional Qualification, and Completeness

| Sensitivity Criteria | Yes | No | NA |
|---|-----|----------------|----|
| Did all analytes meet sensitivity requirements? | | X ¹ | |
| For radiological parameters, if the associated uncertainty was greater than the reported result, the 2 sigma (σ) uncertainty multiplied by 1.65 was less than or equal to the MDC? | | X ² | |
| Additional Qualification Criteria | Yes | No | NA |
| Was professional judgment used to qualify data? | X | | |
| Were multiple results reported for a single analyte? | X | | |
| Total vs Dissolved Analyses | Yes | No | NA |
| Was the dissolved concentration greater than the total concentration? | | | X |
| If either sample result was $>5xRL$, were the RPDs within $\leq 30\%$? | | | X |
| If either sample result was $<5xRL$, was the absolute difference within $2xRL$? | | | X |
| Completeness Criteria | Yes | No | NA |
| Were the reported results usable if qualified? | X | | |
| Were the analyses requested performed, the correct analyte lists used, and correct sample preparation and analyses methods and units utilized? | X | | |

- Several samples were reported as non-detect at elevated reporting limits. These non-detect results will need to be evaluated with respect to project objectives.
- For radiological parameters, the following sample results did not meet the 2σ uncertainty evaluation.

| Sample Identification | Method | Analyte | Result | 2 Sigma (σ) Uncertainty | MDC | Units |
|------------------------------|--------|------------|--------|----------------------------------|------|-------|
| Data Package 60474660 | | | | | | |
| BAT-12-CCR | 903.1 | Radium-226 | 0.670 | 0.730 | 1.19 | pCi/L |
| Data Package 60474729 | | | | | | |
| BAT-03-CCR | 903.1 | Radium-226 | 0.0659 | 0.735 | 1.18 | pCi/L |
| Data Package 60474978 | | | | | | |
| BAT-10-CCR | 903.1 | Radium-226 | 0.843 | 0.897 | 1.46 | pCi/L |
| BAT-02-CCR | 903.1 | Radium-226 | 1.02 | 1.06 | 1.72 | pCi/L |

As the 2σ uncertainty multiplied by 1.65 was greater than the reported minimum detectable concentration (MDC), the associated results were qualified as estimated (J v). The qualified data are presented in Table 2.

Table 1 – Sample Summary and Laboratory Association

| Sample Identification | Collection Date | Laboratory Identification | Sample Type |
|------------------------------|------------------------|----------------------------------|--------------------|

ATTACHMENT A

DATA VALIDATION QUALIFIER DEFINITIONS AND INTERPRETATION KEY

DATA QUALIFIER DEFINITIONS

- U The analyte was analyzed for, but was not detected above the reported sample quantitation limit, or the sample result was considered not-detected due to associated blank contamination.
- J The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- J+ The result is an estimated quantity, but the result may be biased high.
- J- The result is an estimated quantity, but the result may be biased low.
- UJ The analyte was analyzed for, but was not detected. The reported sample quantitation limit is approximate and may be inaccurate or imprecise.
- R The data are unusable. The sample results are rejected due to serious deficiencies in meeting quality control (QC) criteria. The analyte may or may not be present in the sample.

QUALIFIER REASON CODE DEFINITIONS

- be Equipment blank contamination
- bf Field blank contamination
- bl Laboratory blank contamination
- bm Missing Blank Information
- c Calibration issue
- cl Clean-up standard recovery
- cp Insufficient in growth (radiochemical data only)
- cr Chromatographic resolution
- d Reporting limit raised due to chromatographic interference
- dt Dissolved result > total over limit
- fd Field duplicate imprecision
- g Chromatographic pattern match issue
- h Holding times
- i Internal standard areas
- ii Injection internal standard area or retention time exceedance
- k Estimated Maximum Possible Concentrations
- l LCS recoveries
- lc Labeled compound recovery
- ld Laboratory duplicate imprecision (matrix duplicate, MSD, LCSD)
- lq Level of quantitation/trace value
- m Matrix spike recovery
- nb Negative laboratory blank contamination
- p Chemical preservation issue
- pe Post Extraction Spike
- pr Professional Judgement
- q Quantitation issue
- r Dual column RPD
- rp Re-extraction precision issue [PAHs only]
- rt SIM ions not within + 2 seconds
- s Surrogate recovery
- sp Sample preparation issue
- su Evidence of ion suppression
- t Temperature Preservation Issue
- u High combined sample result uncertainty (radiochemical data Only)
- v compound identification issue
- x Low % solids
- y Serial dilution results
- z ICS results

September/October 2025

October 27, 2025

Vasanta Kalluri
AECOM
6200 South Quebec Street
Greenwood Village, CO 80111

RE: Project: 60754415 PRPA CCR
Pace Project No.: 10752029

Dear Vasanta Kalluri:

Enclosed are the analytical results for sample(s) received by the laboratory on October 03, 2025. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Minneapolis

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Tina Soltani

REPORT OF LABORATORY ANALYSIS

This report shall not be reproduced, except in full, without the written consent of Pace Analytical Services, LLC.

QUALIFIERS

Project: 60754415 PRPA CCR

Pace Project No.: 10752029

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

D3 Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.

P6 Matrix spike recovery was outside laboratory control limits due to a parent sample concentration notably higher than the spike level.

PP The mass of dried residue obtained did not meet the test method requirements based on volume used.

Greenwood Village, CO 80111

RE: Project: 60754415 PRPA CCR
Pace Project No.: 10752259

Dear Vasanta Kalluri:

Enclosed are the analytical results for sample(s) received by the laboratory on October 07, 2025. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Minneapolis

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Tina Soltani

QUALIFIERS

Project: 60754415 PRPA CCR

Pace Project No.: 10752259

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

D3 Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.

E Analyte concentration exceeded the calibration range. The reported result is estimated.

P6 Matrix spike recovery was outside laboratory control limits due to a parent sample concentration notably higher than the spike level.

PL The minimum mass of dried residue of 2.5 mg could not be obtained using the routine sample volume of 100 mL.

PP The mass of dried residue obtained did not meet the test method requirements based on volume used.

RE: Project: 60754415 PRPA CCR
Pace Project No.: 10752265

Dear Vasanta Kalluri:

Enclosed are the analytical results for sample(s) received by the laboratory on October 07, 2025. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Minneapolis

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Tina Soltani
tina.soltani@pacelabs.com

REPORT OF LABORATORY ANALYSIS

This report shall not be reproduced, except in full, without the written consent of Pace Analytical Services, LLC.

QUALIFIERS

Project: 60754415 PRPA CCR

Pace Project No.: 10752265

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

D3 Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.

E Analyte concentration exceeded the calibration range. The reported result is estimated.

P6 Matrix spike recovery was outside laboratory control limits due to a parent sample concentration notably higher than the spike level.

PP The mass of dried residue obtained did not meet the test method requirements based on volume used.

RE: Project: 60754415 PRPA CCR
Pace Project No.: 10752464

Dear Vasanta Kalluri:

Enclosed are the analytical results for sample(s) received by the laboratory on October 08, 2025. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Minneapolis

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Tina Soltani
tina.soltani@pacelabs.com

REPORT OF LABORATORY ANALYSIS

This report shall not be reproduced, except in full, without the written consent of Pace Analytical Services, LLC.

QUALIFIERS

Project: 60754415 PRPA CCR

Pace Project No.: 10752464

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

D3 Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.

E Analyte concentration exceeded the calibration range. The reported result is estimated.

M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

P6 Matrix spike recovery was outside laboratory control limits due to a parent sample concentration notably higher than the spike level.

PP The mass of dried residue obtained did not meet the test method requirements based on volume used.

RE: Project: 60754415 PRPA CCR
Pace Project No.: 10752477

Dear Vasanta Kalluri:

Enclosed are the analytical results for sample(s) received by the laboratory on October 03, 2025. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Greensburg

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Tina Soltani
tina.soltani@pacelabs.com

QUALIFIERS

Project: 60754415 PRPA CCR

Pace Project No.: 10752477

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Act - Activity

Unc - Uncertainty: SDWA = 1.96 sigma count uncertainty, all other matrices = Expanded Uncertainty (95% confidence interval).

Gamma Spec = Expanded Uncertainty (95.4% Confidence Interval)

(MDC) - Minimum Detectable Concentration

Trac - Tracer Recovery (%)

Carr - Carrier Recovery (%)

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

RE: Project: 60754415 PRPA CCR
Pace Project No.: 10752478

Dear Vasanta Kalluri:

Enclosed are the analytical results for sample(s) received by the laboratory on October 07, 2025. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Greensburg

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Tina Soltani
tina.soltani@pacelabs.com

QUALIFIERS

Project: 60754415 PRPA CCR

Pace Project No.: 10752478

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Act - Activity

Unc - Uncertainty: SDWA = 1.96 sigma count uncertainty, all other matrices = Expanded Uncertainty (95% confidence interval).

Gamma Spec = Expanded Uncertainty (95.4% Confidence Interval)

(MDC) - Minimum Detectable Concentration

Trac - Tracer Recovery (%)

Carr - Carrier Recovery (%)

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

RE: Project: 60754415 PRPA CCR
Pace Project No.: 10752482

Dear Vasanta Kalluri:

Enclosed are the analytical results for sample(s) received by the laboratory on October 08, 2025. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Greensburg

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Tina Soltani
tina.soltani@pacelabs.com

QUALIFIERS

Project: 60754415 PRPA CCR

Pace Project No.: 10752482

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Act - Activity

Unc - Uncertainty: SDWA = 1.96 sigma count uncertainty, all other matrices = Expanded Uncertainty (95% confidence interval).

Gamma Spec = Expanded Uncertainty (95.4% Confidence Interval)

(MDC) - Minimum Detectable Concentration

Trac - Tracer Recovery (%)

Carr - Carrier Recovery (%)

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

Data Validation Report

Project/Site: Platte River Power Authority/CCR BAT Wells
Validating Chemist: Manasa M B
Secondary Review Chemist: Jamie Herman

Event: 2SA Groundwater 2025
Date: 12/10/2025
Date: 12/17/2025

Introduction:

This validation report documents the data review through the checklists below. Further identification and explanation of the anomalies identified through the validation process are provided following each section of the checklist, as needed.

The field sample and laboratory identification associations are summarized in Table 1. Qualified data are summarized and presented in Table 2. Data were qualified per the qualifiers and reason codes presented in Attachment A.

In instances where multiple validation qualifiers were applied with an associated bias (J+ or J-), the final validation qualifier reflects the overall bias considering all qualifications. For example, if a sample was qualified with both a high (J+) and low bias (J-), the overall qualification was J with no affiliated bias.

Laboratory and Sample Delivery Groups (SDGs):

Pace Analytical Services in Minneapolis MN – 10752259, 10752265, 10752464, 10752029

Pace Analytical Services in Greensburg, Pennsylvania – 10752478, 10752482, 10752477

Analytical Methods Validated:

Anions (chloride, sulfate, fluoride) by EPA Method 300.0, total metals (select list) by EPA Method 6020B, total mercury by EPA Method 7470A, total dissolved solids (TDS) by SM2540C, radium-226 by EPA Method 903.1, radium-228 by EPA method 904.0, and total radium calculation (TRC).

Validation:

Stage 2A Validation

Validation Guidance Documents:

The data review was conducted in accordance with *National Functional Guidelines for Inorganic Superfund Methods Data Review* (EPA November 2020), and evaluation of laboratory criteria, as applicable.

Overall Assessment of Data:

As no data were missing or qualified as unusable during the validation process, the overall assessment of data was acceptable at 100%. Qualified data are summarized and presented in Table 2.

Data Validation Report

Date: 12/17/2025

1.0 Sample Documentation and Case Narrative

| Sample Documentation Criteria | Yes | No | NA |
|--|----------------|----|----|
| Were all samples documented correctly on the chain-of-custody (COC) and container labels? | X | | |
| Were sample analyses completed per the COC? | X ¹ | | |
| Were samples extracted and analyzed within the method required holding times? | X | | |
| Laboratory Case Narrative | Yes | No | NA |
| Were there additional narrative clarifications made by the laboratory, not addressed within this validation? | X ¹ | | |

1. **Data Packages 10752029 and 10752477:** Both ASH and BAT wells were included on the same COC and reported by the laboratory. Only the BAT well is evaluated within this validation report; the ASH well is evaluated under a separate cover.

Data Packages 10752259, 10752265, and 10752464: The dry residue obtained for TDS analysis did not meet Method SM2540C requirements for samples BAT-02-CCR, BAT-05-CCR, ERB-02-CCR, BAT-06-CCR, BAT-01-CCR, BAT-09-CCR, BAT-03-CCR, and BAT-10-CCR. The associated results were qualified as estimated (J/UJ pr).

Data Packages 10752464 and 10752482: The laboratory noted that there was no time listed on COC or containers for the sample FD-02-CCR. This is a blind field duplicate and no further action was necessary.

Date: 12/17/2025

2.0 Quality Control and Performance Checks

| Stage 2A Validation Criteria | | | |
|---|---|----------------|-----------|
| Method Blank Criteria | Yes | No | NA |
| Was a method blank analyzed for each batch, as applicable to the method? | X | | |
| Were method blank concentrations reported as not detected or less than the MDC? | X | | |
| Laboratory Control Sample Criteria | Yes | No | NA |
| Was an LCS reported with each preparation batch, as applicable to the method? | X | | |
| Were LCS/LCSD recoveries and/or RPDs within acceptance criteria? | | X ¹ | |
| Matrix Spike/Matrix Spike Duplicates Criteria | Yes | No | NA |
| Was an MS/MSD performed on a project specific sample? | X | | |
| Parent Sample | Method | | |
| BAT-04R-CCR | 7470A, 6020B, SM2540C, 300.0, 903.1, 904.0, TRC | | |
| BAT-01-CCR | 300.0 | | |
| For concentrations <4x the spike concentration, were MS/MSD recoveries and RPDs within acceptance criteria? | X | | |
| Spike recovery limits and RPDs are not applicable when the parent sample concentration is ≥ 4x the spike added. The data is reported without qualification. | | | |
| Laboratory Duplicate Criteria – As applicable to the analytical method | Yes | No | NA |
| Was a laboratory duplicate performed on a project specific sample? | X | | |
| If both the parent sample and duplicate values were >5xRL, was laboratory duplicate RPD within laboratory acceptance criteria? | X | | |
| If either the parent sample or duplicate value was <5xRL, was the absolute difference within acceptance criteria of <2xRL for waters, and <3.5xRL for solids? | X | | |
| For radiological parameters, was the DER agreement between parent sample results and laboratory duplicate sample results ≤2? | X | | |
| Tracery/Carrier Recovery - Radiological | Yes | No | NA |
| The sample specific recoveries were within the laboratory limits (30-110%). | X | | |

1. The following laboratory control samples were outside the QC acceptance criteria:

| LCS Identification | Method | Analyte | Recovery | Recovery Limit | RPD/RER | RPD/RER Limit |
|------------------------------|--------|------------|----------|----------------|---------|---------------|
| Data Package 10752478 | | | | | | |
| LCS 87577 LCSD 87577 | 903.1 | Radium 226 | 83/137 | 73-133 | -1.4 | 2 |

In instances where the LCS recovery was greater than the upper acceptance limit, the associated detected results were qualified as estimated (J+ 1) to demonstrate the potential high bias.

Data Validation Report

Project/Site: Platte River Power Authority/CCR BAT Wells
Validating Chemist: Manasa M B
Secondary Review Chemist: Jamie Herman

Event: 2SA Groundwater 2025
Date: 12/10/2025
Date: 12/17/2025

3.0 Field Quality Control Samples

| Field QC Blank Criteria | | Yes | No | NA |
|--|------------------------|-----|----------------|----|
| Was a trip blank shipped with, and analyzed with the samples? | | | | X |
| Were trip blank concentrations reported as non-detect for target analytes? | | | | X |
| Were field and/or equipment blanks collected and analyzed with the samples? | | X | | |
| Were field QC blank concentrations reported as non-detect or less than the MDC for radiological parameters, for the target analytes? | | | X ¹ | |
| Field Duplicate Criteria | | Yes | No | NA |
| Were field duplicate samples collected for this sampling event? | | X | | |
| Parent Sample | Field Duplicate Sample | | | |
| BAT-12-CCR | FD-02-CCR | | | |
| If both the parent sample and/field duplicate sample results were >5xRL were the RPDs within the acceptance criteria of ≤30%? | | X | | |
| If either the parent sample or duplicate value was <5xRL, was the absolute difference within the acceptance criteria of <2xRL? | | X | | |
| For radiological parameters, was the DER agreement between parent sample results and field duplicate sample results ≤2? | | X | | |

- The following analytes were reported as detected in the equipment blank:

| Blank Identification | Method | Analyte | Blank result | Associated samples | Sample result | Unit |
|------------------------------|--------|------------|--------------|--------------------|---------------|-------|
| Data Package 10752478 | | | | | | |
| ERB-02-CCR | 904.0 | Radium-228 | 1.04 | BAT-06-CCR | 0.469 | pCi/L |
| | | | | BAT-01-CCR | 0.614 | pCi/L |
| | | | | BAT-09-CCR | 1.58 | pCi/L |
| | | | | BAT-03-CCR | 0.515 | pCi/L |
| | | | | BAT-05-CCR | 1.57 | pCi/L |
| | | | | BAT-02-CCR | 1.03 | pCi/L |

The associated sample results were qualified as estimated (J be) due to equipment blank contamination.

Data Validation Report

Project/Site: Platte River Power Authority/CCR BAT Wells
Validating Chemist: Manasa M B
Secondary Review Chemist: Jamie Herman

Event: 2SA Groundwater 2025
Date: 12/10/2025
Date: 12/17/2025

4.0 Sensitivity, Additional Qualification, and Completeness

| Sensitivity Criteria | Yes | No | NA |
|---|------------|----------------|-----------|
| Did all analytes meet sensitivity requirements? | | X ¹ | |
| For radiological parameters, if the associated uncertainty was greater than the reported result, the 2 sigma (σ) uncertainty multiplied by 1.65 was less than or equal to the MDC? | | X ¹ | |
| Additional Qualification Criteria | Yes | No | NA |
| Was professional judgment used to qualify data? | | X | |
| Were multiple results reported for a single analyte? | | X | |
| Total vs Dissolved Analyses | Yes | No | NA |
| Was the dissolved concentration greater than the total concentration? | | | X |
| If either sample result was $>5xRL$, were the RPDs within $\leq 30\%$? | | | X |
| If either sample result was $<5xRL$, was the absolute difference within $2xRL$? | | | X |
| Completeness Criteria | Yes | No | NA |
| Were the reported results usable if qualified? | X | | |
| Were the analyses requested performed, the correct analyte lists used, and correct sample preparation and analyses methods and units utilized? | X | | |

- Several samples were reported as non-detect at elevated reporting limits. These non-detect results will need to be evaluated with respect to project objectives.

For radiological parameters, the following sample results did not meet the 2σ uncertainty evaluation.

| Sample Identification | Method | Analyte | Result | 2 Sigma (σ) Uncertainty | MDC | Units |
|------------------------------|---------------|----------------|---------------|--|------------|--------------|
| Data Package 10752478 | | | | | | |
| BAT-03-CCR | 903.1 | Radium-226 | 0.269 | ± 0.281 | 0.396 | pCi/L |
| BAT-05-CCR | 904.0 | Radium-228 | 1.57 | ± 0.554 | 0.789 | pCi/L |
| BAT-02-CCR | 903.1 | Radium-226 | 0.437 | ± 0.327 | 0.169 | pCi/L |
| Data Package 10752482 | | | | | | |
| BAT-12-CCR | 903.1 | Radium-226 | 0.134 | ± 0.305 | 0.181 | pCi/L |
| BAT-11-CCR | 903.1 | Radium-226 | 0.0724 | ± 0.330 | 0.533 | pCi/L |

As the 2σ uncertainty multiplied by 1.65 was greater than the reported minimum detectable concentration (MDC), the associated results were qualified as estimated (J v).

Table 1 – Sample Summary and Laboratory Association

| Sample Identification | Collection Date | Laboratory Identification | Sample Type |
|------------------------------|------------------------|----------------------------------|--------------------|
| Data Package 10752259 | | | |

ATTACHMENT A

DATA QUALIFIER DEFINITIONS

- U The analyte was analyzed for but was not detected above the reported sample quantitation limit, or the sample result was considered not-detected due to associated blank contamination.
- J The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- J+ The result is an estimated quantity, but the result may be biased high.
- J- The result is an estimated quantity, but the result may be biased low.
- UJ The analyte was analyzed for but was not detected. The reported sample quantitation limit is approximate and may be inaccurate or imprecise.
- R The data are unusable. The sample results are rejected due to serious deficiencies in meeting quality control (QC) criteria. The analyte may or may not be present in the sample.

QUALIFIER REASON CODE DEFINITIONS

- be Equipment blank contamination
- bf Field blank contamination
- bl Laboratory blank contamination
- bm Missing Blank Information
- c Calibration issue
- cl Clean-up standard recovery
- cp Insufficient growth (radiochemical data only)
- cr Chromatographic resolution
- d Reporting limit raised due to chromatographic interference
- dt Dissolved result > total over limit
- fd Field duplicate imprecision
- g Chromatographic pattern match issue
- h Holding times
- i Internal standard areas
- ii Injection internal standard area or retention time exceedance
- k Estimated Maximum Possible Concentrations
- l LCS recoveries
- lc Labeled compound recovery
- ld Laboratory duplicate imprecision (matrix duplicate, MSD, LCSD)
- lq Level of quantitation/trace value
- m Matrix spike recovery
- nb Negative laboratory blank contamination
- p Chemical preservation issue
- pe Post Extraction Spike
- pr Professional Judgement
- q Quantitation issue
- r Dual column RPD
- rp Re-extraction precision issue [PAHs only]
- rt SIM ions not within + 2 seconds
- s Surrogate recovery
- sp Sample preparation issue
- su Evidence of ion suppression
- t Temperature Preservation Issue
- u High combined sample result uncertainty (radiochemical data Only)
- v compound identification issue
- x Low % solids
- y Serial dilution results
- z ICS results

| 373 | Gamma ROS Statistics using Imputed Non-Detects | | | | | | | | | | |
| 374 | GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs | | | | | | | | | | |
| 375 | GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20) | | | | | | | | | | |
| 376 | For such situations, GROS method may yield incorrect values of UCLs and BTVs | | | | | | | | | | |
| 377 | This is especially true when the sample size is small. | | | | | | | | | | |
| 378 | For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates | | | | | | | | | | |

| 133 | | | | | | | | | | | | |
| 134 | | | Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20. | | | | | | | | | |
| 135 | | | Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers | | | | | | | | | |
| 136 | | | and consists of observations collected from clean unimpacted locations. | | | | | | | | | |
| 137 | | | The use of USL tends to provide a balance between false positives and false negatives provided the data | | | | | | | | | |
| 138 | | | represents a background data set and when many onsite observations need to be compared with the BTV. | | | | | | | | | |

| 190 | | | | Gamma ROS Statistics using Imputed Non-Detects | | | | | | | | |
| 191 | | | | GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs | | | | | | | | |
| 192 | | | | GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20) | | | | | | | | |
| 193 | | | | For such situations, GROS method may yield incorrect values of UCLs and BTVs | | | | | | | | |
| 194 | | | | This is especially true when the sample size is small. | | | | | | | | |
| 195 | | | | For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates | | | | | | | | |
| 196 | | | | Minimum | 0.01 | | | | | Mean | 1.178 | |

| 506 | | | | 95% USL | 10 | | | | | 95% KM Chebyshev UPL | 3.203 | |
| 507 | | | | | | | | | | | | |
| 508 | | | | Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20. | | | | | | | | |
| 509 | | | | Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers | | | | | | | | |
| 510 | | | | and consists of observations collected from clean unimpacted locations. | | | | | | | | |
| 511 | | | | The use of USL tends to provide a balance between false positives and false negatives provided the data | | | | | | | | |
| 512 | | | | represents a background data set and when many onsite observations need to be compared with the BTV. | | | | | | | | |

| 693 | Gamma ROS Statistics using Imputed Non-Detects | | | | | | | | | | |
| 694 | GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs | | | | | | | | | | |
| 695 | GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20) | | | | | | | | | | |
| 696 | For such situations, GROS method may yield incorrect values of UCLs and BTVs | | | | | | | | | | |
| 697 | This is especially true when the sample size is small. | | | | | | | | | | |
| 698 | For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates | | | | | | | | | | |

| 1233 | | | | Gamma ROS Statistics using Imputed Non-Detects | | | | | | | | | |
| 1234 | | | | GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs | | | | | | | | | |
| 1235 | | | | GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20) | | | | | | | | | |
| 1236 | | | | For such situations, GROS method may yield incorrect values of UCLs and BTVs | | | | | | | | | |
| 1237 | | | | This is especially true when the sample size is small. | | | | | | | | | |
| 1238 | | | | For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates | | | | | | | | | |
| 1239 | | | | Minimum | | 1.5 | | | | Mean | | 65.84 | |
